**SPACING**

# 12 PRINCIPLES OF ANIMATION

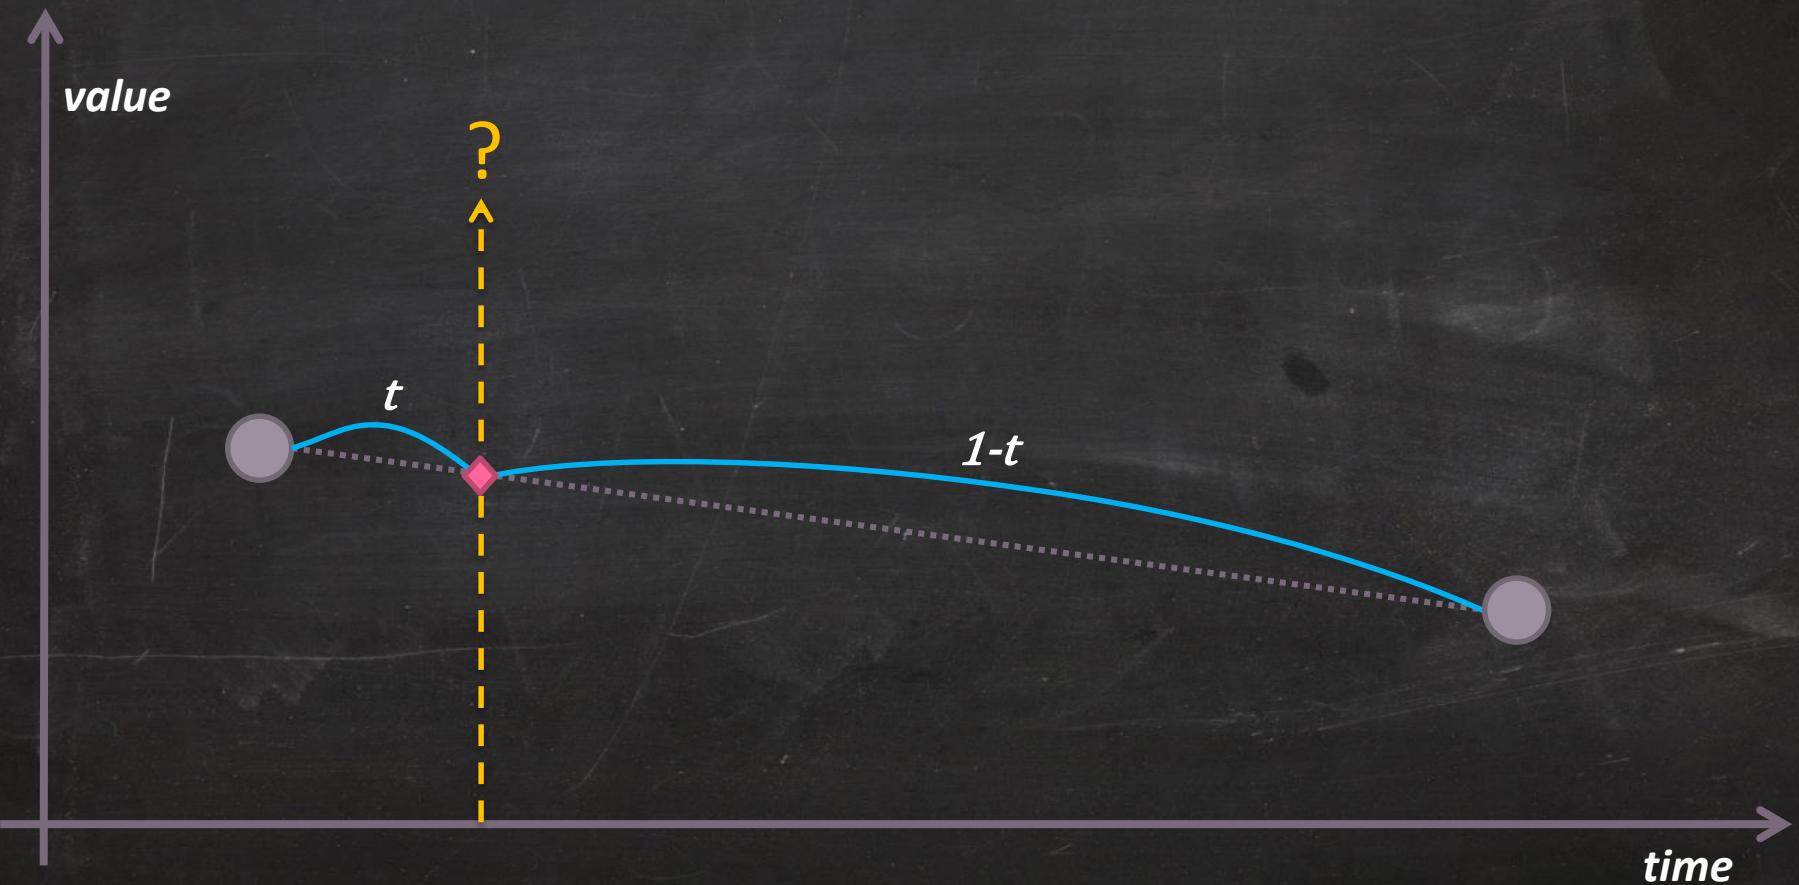

# Animation Principles

- 1. *Squash & Stretch*
- 2. *Anticipation*
- 3. *Arcs*
- 4. *Ease In & Ease Out*
- 5. *Appeal*
- 6. *Timing*
- 7. *Solid Drawing*
- 8. *Exaggeration*
- 9. *Pose To Pose*
- 10. *Staging*
- 11. *Secondary Motion*
- 12. *Following Through*

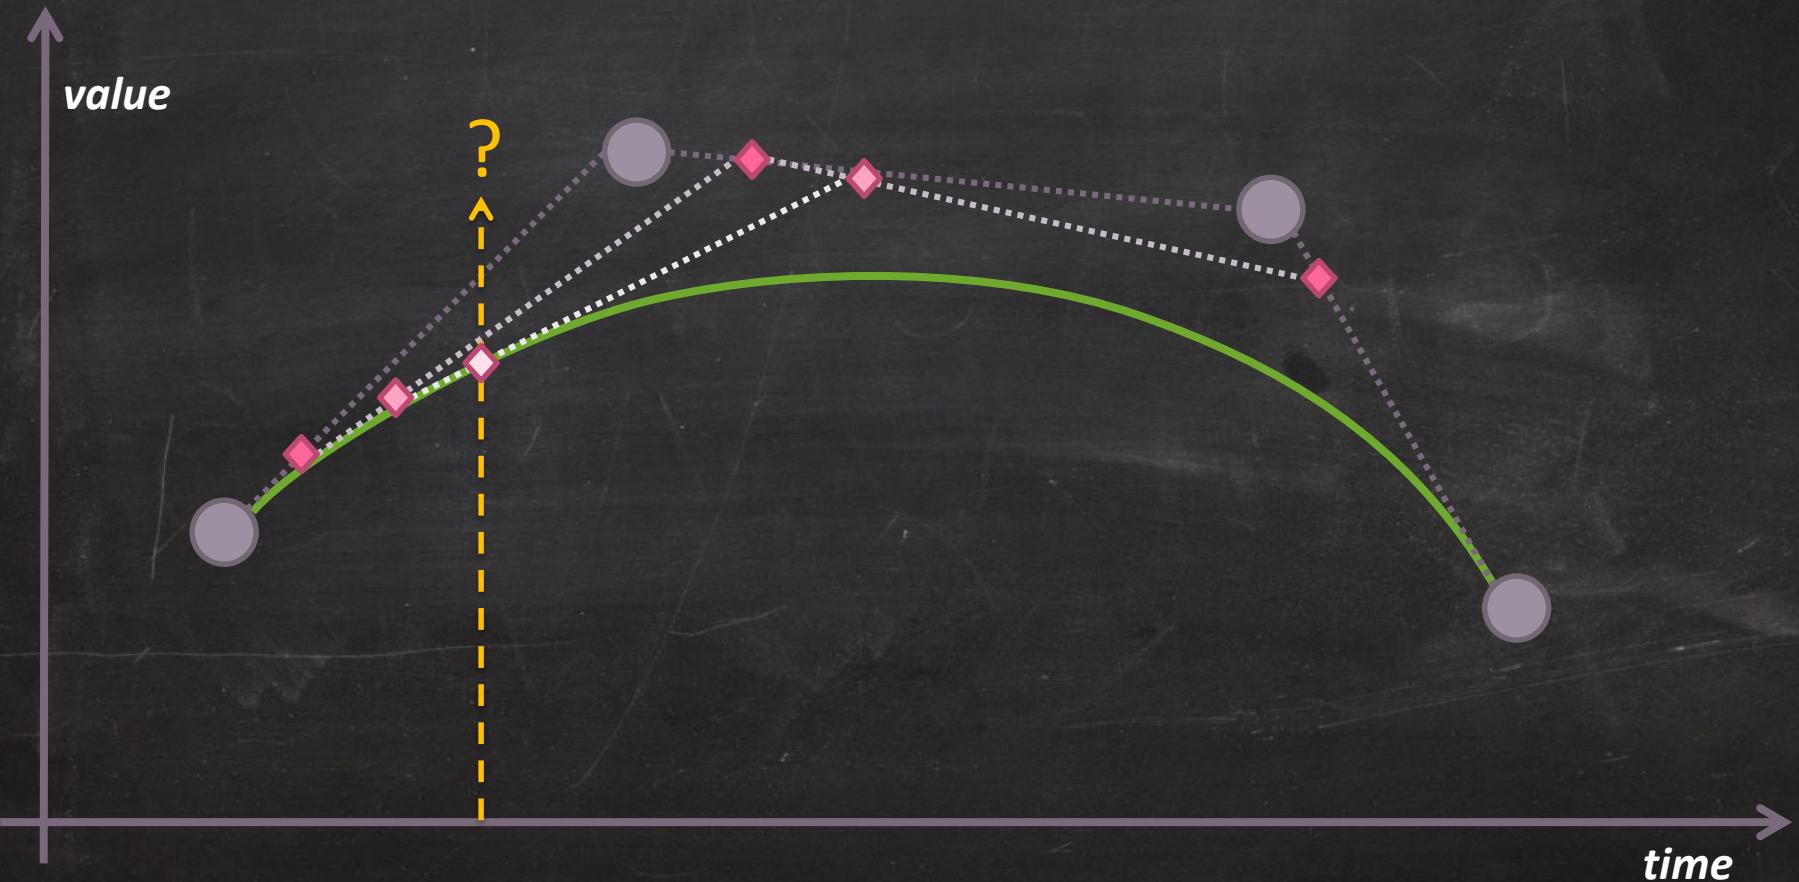

# Key-frame Animation

- Animator specifies key-frames, software generate the frames in-between
  - **Interpolation** is the major operation in
    - time-variant transformations
    - pose-to-pose deformation
- Many animation principles can be modeled from physical law
  - Ex. Squash & stretch, following through, etc.

# Data Interpolation

# Data Interpolation - Cubic Bezier

# Interpolation with Parametric Curves

- Cubic Bezier
  - 4 positions
- Catmull-Rom
  - 2 positions, 2 tangents (derived from nearby CVs)
- Hermit Curve
  - 2 (position + tangent)
    - tangents are specified at each CV

# Considerations

- Local control
  - Each CV only affects neighboring segments
  - That's why we need splines
- Smoothness, degree of continuity
  - $C^0$ : matches position
  - $C^1$ : matches tangent
  - $C^2$ : matches curvature

# Cartesian Unit Vectors

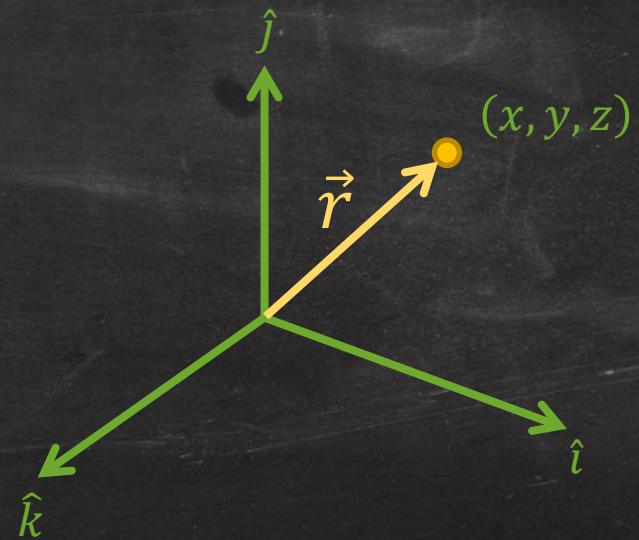

- $\hat{i}, \hat{j}, \hat{k}$ 
  - Coordinate axes
  - Orthonormal
  - Can be drawn at any location, not just at origin
    - Invariant at different locations
- Vector components
  - Projections of the vector onto the coordinate axes

*René Descartes (1596-1650)*

# Change Axes in Cartesian Coordinate

- Geometric information = coordinates + unit basis
  - Coordinates are **meaningless without** unit basis
- $\vec{r}$  = **displacement vector**
- $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$

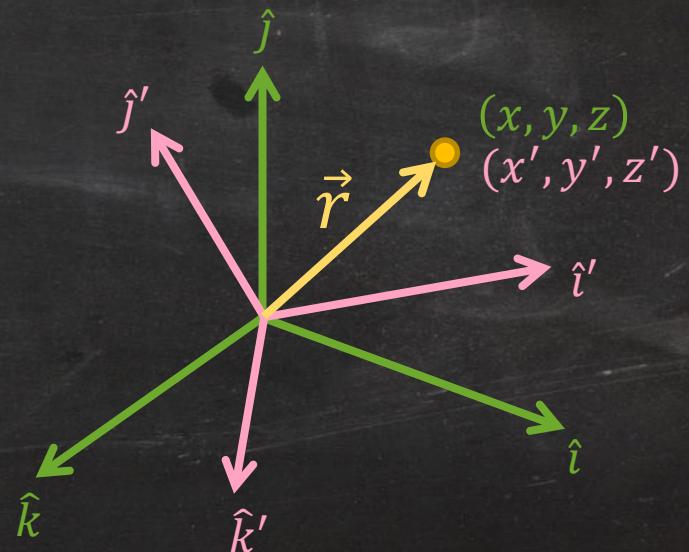

# Change Axes in Cartesian Coordinate

- Geometric information = coordinates + unit basis
  - Coordinates are **meaningless without** unit basis
- $\vec{r}$  = **displacement vector**
- $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$   
 $= x'\hat{i}' + y'\hat{j}' + z'\hat{k}'$

$\vec{r}$  is **fixed!**

But its components **change!**

# Two Types of Transformations

- Coordinate-system transformations
  - Transform basis vector
  - Vector is **the same**, but components change

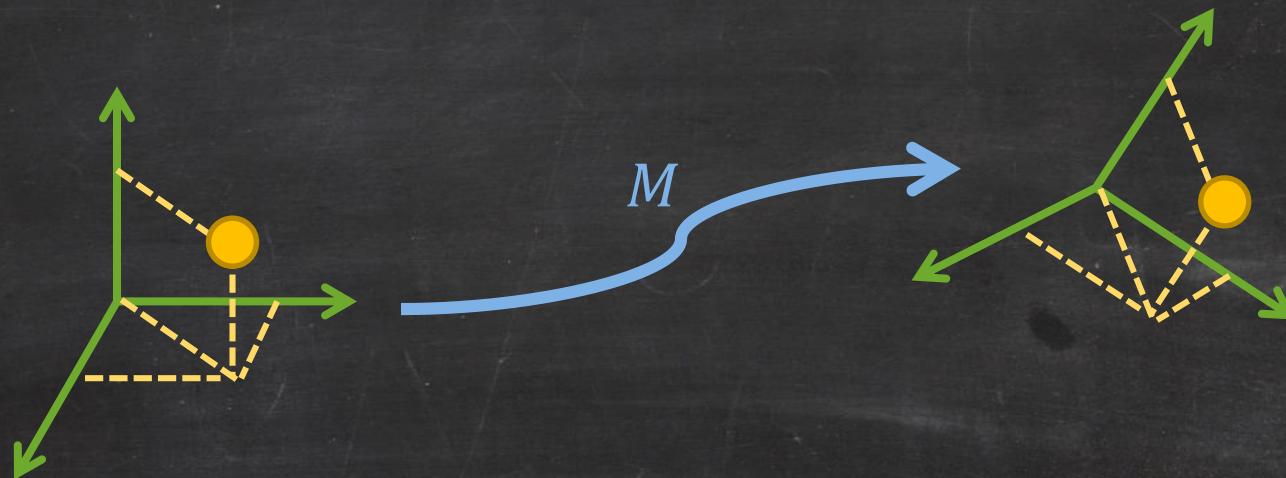

World-View-Projection transformation in rendering pipeline

- Transform vector in the same coordinate
  - Vector is **different** from original one

Animation in certain reference frame (ex. world space)

# Orientation = Rotation

$$\begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} t_1 & n_1 & b_1 \\ t_2 & n_2 & b_2 \\ t_3 & n_3 & b_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$

# Orientation = Rotation

The diagram illustrates a coordinate system transformation. On the left, a green coordinate system is shown with a yellow dot at its origin. A dashed line connects the origin to the dot. A blue arrow labeled  $M$  points to the right, indicating the transformation. On the right, the coordinate system has been rotated, and the yellow dot is now located at a new position relative to the rotated axes.

$$\begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} t_1 & n_1 & b_1 \\ t_2 & n_2 & b_2 \\ t_3 & n_3 & b_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} t_1 \\ t_2 \\ t_3 \end{bmatrix} x + \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} y + \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} z$$

coordinates

unit basis

orthogonal matrix:  $R^T R = I$

# Group

- A family of transformations forms a **group**
- A set  $G$  together with a binary operation  $\circ$  defined on elements of  $G$  is called a group, if it satisfies the axioms of ***closure, identity, inverse and associativity***

# Group (Cont'd)

Closure

$$g_1, g_2 \in G \rightarrow g_1 \circ g_2 \in G$$

Identity

$$\exists e \in G: g \circ e = e \circ g = g$$

Inverse

$$\forall g \exists g^{-1} \in G: g \circ g^{-1} = g^{-1} \circ g = e$$

Associativity

$$g_1, g_2, g_3 \in G, \quad g_1 \circ (g_2 \circ g_3) = (g_1 \circ g_2) \circ g_3$$

# Two Special Groups in 3D

- SO: Special Orthogonal group
  - $SO(3) = \{R \in \mathbb{R}^{3 \times 3} : RR^T = I, \det R = +1\}$ 
    - 3D rotations centered at the origin
- SE: Special Euclidean Group
  - $SE(3) = \{(p, R) : p \in \mathbb{R}^3, R \in SO(3)\} = \mathbb{R}^3 \times SO(3)$ 
    - 3D rotations + translations
    - Rigid motion => preserve distance and orientation

# Interpolating Rotation Matrices

$$0.5 \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} + 0.5 \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

90° CW around z-axis                    90° CCW around z-axis

# Interpolating Rotation Matrices

$$0.5 \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} + 0.5 \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & ? & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

90° CW around z-axis                    90° CCW around z-axis

Oops!! This is **NOT** a rotation matrix!!

Rotation matrix is a group with multiplication **NOT** addition

# Representations of Rotations

- Rotation matrix
- Axis-angle
- Euler Angle
- Quaternion
- and many more...

<http://rotations.berkeley.edu>

After seeing this site, I just realized I didn't know much about rotations at all...

# Euler's Rotation Theorem

- In 3D space, any sequence of rotations about a fixed point is equivalent to a **single** rotation by a given angle  $\theta$  about a fixed axis

Leonhard Euler (1707-1783)

# Axis-Angle

- Specify rotation axis  $\hat{\omega}$ , and rotation angle  $\|\vec{\omega}\|$

$$\vec{r}'_{\perp} = \cos \theta \vec{r}_{\perp} + \sin \theta (\hat{\omega} \times \vec{r})$$

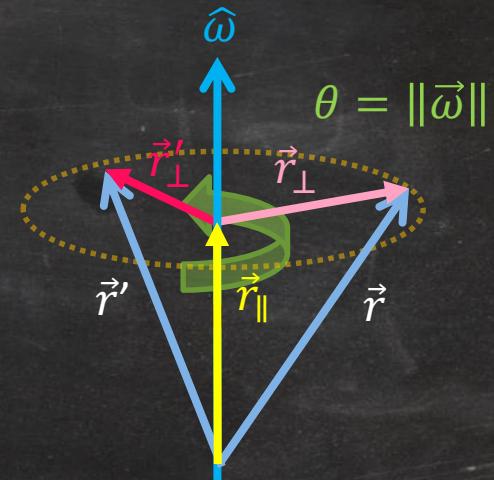

$$\vec{r}_{\perp} = \vec{r} - \vec{r}_{\parallel} = \vec{r} - (\vec{r} \cdot \hat{\omega})\hat{\omega}$$

$$\vec{r}' = \vec{r}'_{\perp} + \vec{r}_{\parallel}$$

$$= \cos \theta (\vec{r} - (\vec{r} \cdot \hat{\omega})\hat{\omega}) + \sin \theta (\hat{\omega} \times \vec{r}) + (\vec{r} \cdot \hat{\omega})\hat{\omega}$$

$$[\boxed{= \cos \theta \vec{r} + \sin \theta (\hat{\omega} \times \vec{r}) + (1 - \cos \theta)((\vec{r} \cdot \hat{\omega})\hat{\omega})}]$$

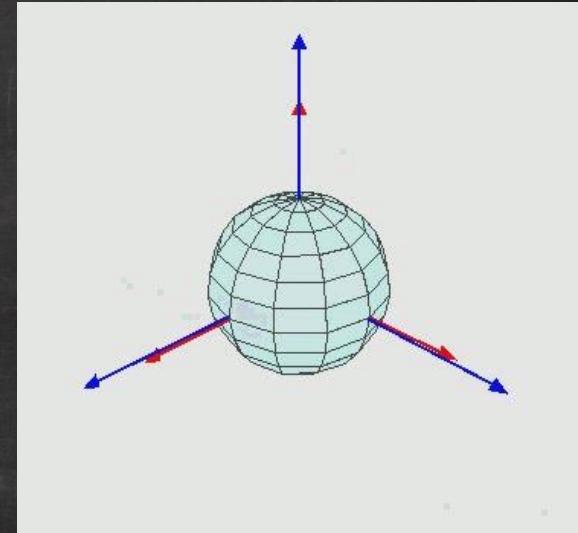

# Euler's Rotation Theorem (in 3D Space)

- Any two **orthonormal** coordinate frames can be related by a sequence of rotations (not more than three) about coordinate axes
- Any two **Cartesian coordinate systems** with a common origin are related by a rotation about some fixed axis

# Euler Angle

- $R(\alpha, \beta, \gamma) = R_z(\gamma)R_y(\beta)R_x(\alpha)$ 
  - Product of 3 rotations around local axes
  - Rotation order is important!
    - Ex. XYZ, ZXY, YZX, etc.
- ✓ Intuitive control
- ✓ Smallest representation possible
- ✗ Non-unique representation for a given orientation
- ✗ Hard to interpolate
- ✗ Gimbal lock

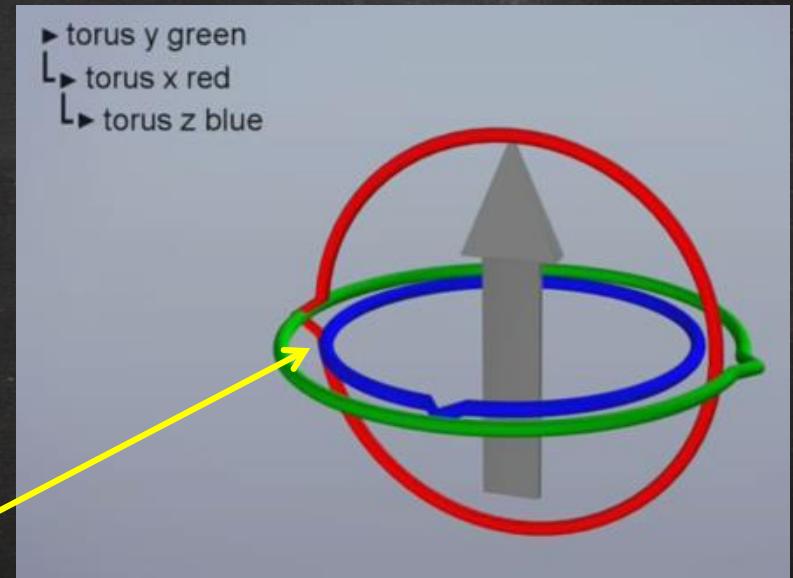

# Degree of Freedom (DOF)

- A variable describing a particular axis or dimension of movement
  - 3D Rotation: 3DOFs
    - Axis-angle: axis  $\theta, \phi$  and rotation radius  $\alpha$
    - Euler angle:  $\alpha, \beta, \gamma$
  - Rigid body transformation in 3D: 6 DOFs
    - 3 for translation and 3 for rotation

# Gimbal Lock

- When the second rotation value is  $\pm\pi/2$ , one degree of freedom (DOF) would be lost
- Can we use any specific rotation order to avoid this?
  - Not possible!! 😞

**z-axis is aligned with y-axis!!**

# Singularity

- A continuous subspace of the parameter space, where
  - all elements correspond to **the same** rotation
  - any movement within the subspace produces **no** change in rotation
- **NEVER** be eliminated in any 3-dimensional representation of  $\text{SO}(3)$ 
  - That's why do we need quaternion!

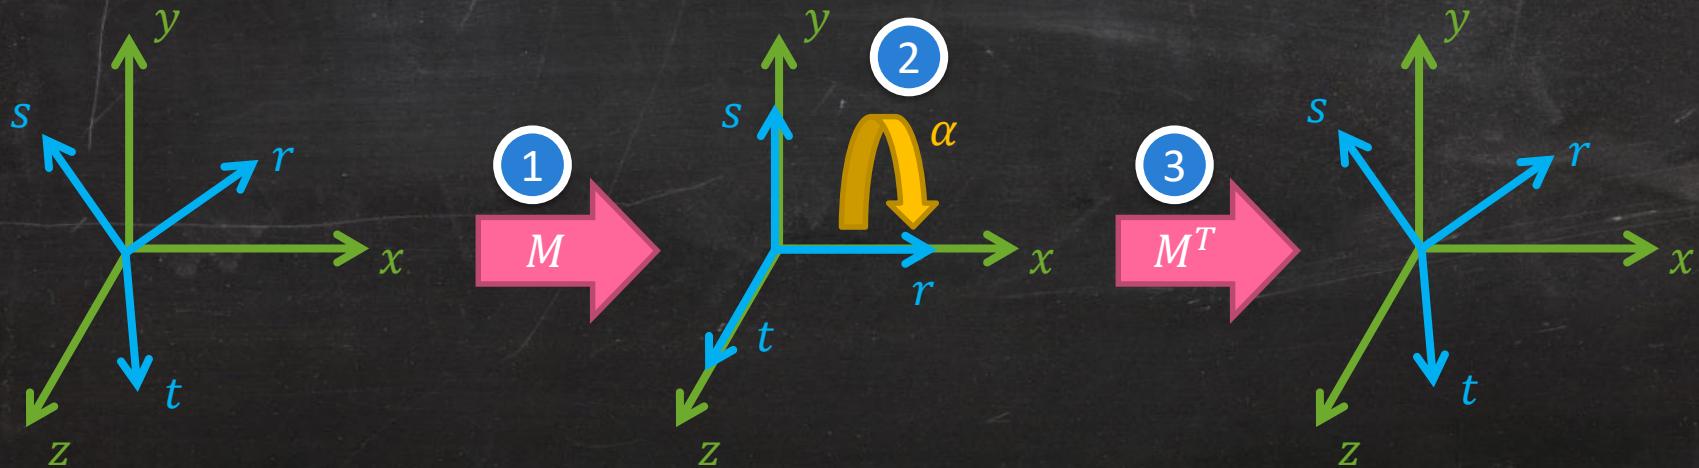

# Singularity

When you go east at the North Pole, you are still at **the same** position!!

- A continuous subspace of the parameter space, where
  - all elements correspond to **the same** rotation
  - any movement within the subspace produces **no** change in rotation
- **NEVER** be eliminated in any 3-dimensional representation of  $SO(3)$ 
  - That's why do we need quaternion!

# Rotate About an Arbitrary Axis

1. Change to new frame
2. Rotate  $\alpha$  radians around
3. Transform back to standard basis

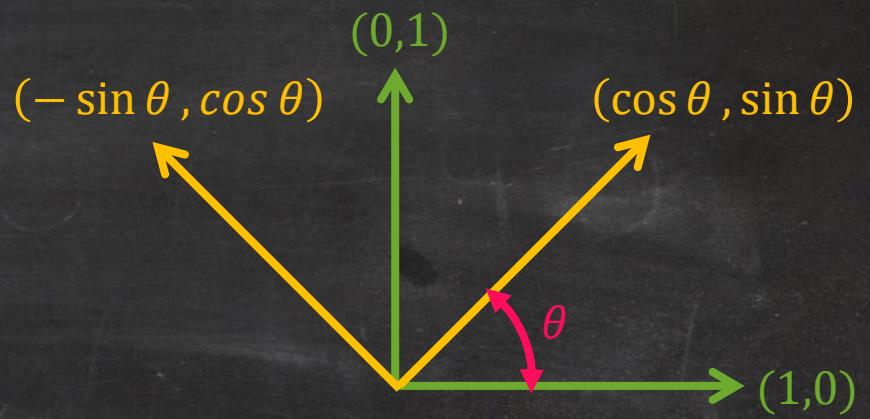

# 2D Rotation in Complex Plane

$$(x' + y'i) = e^{i\theta} (x + yi)$$

where  $e^{i\theta} = \cos \theta + i \sin \theta$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

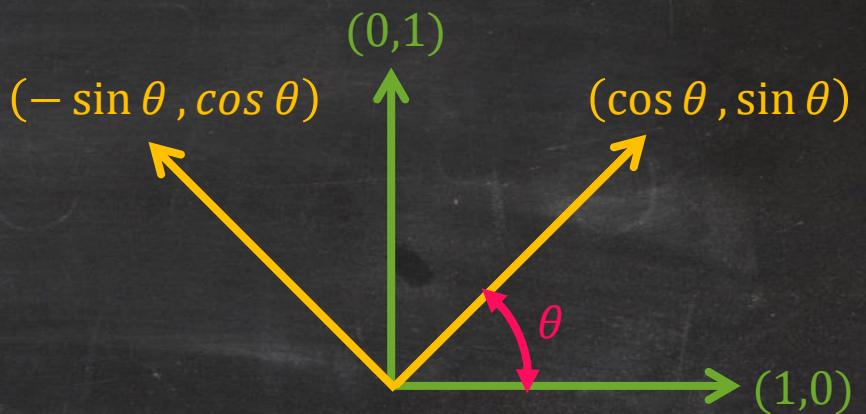

# 2D Rotation in Complex Plane

$$(x' + y'i) = e^{i\theta} (x + yi)$$

where  $e^{i\theta} = \cos \theta + i \sin \theta$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

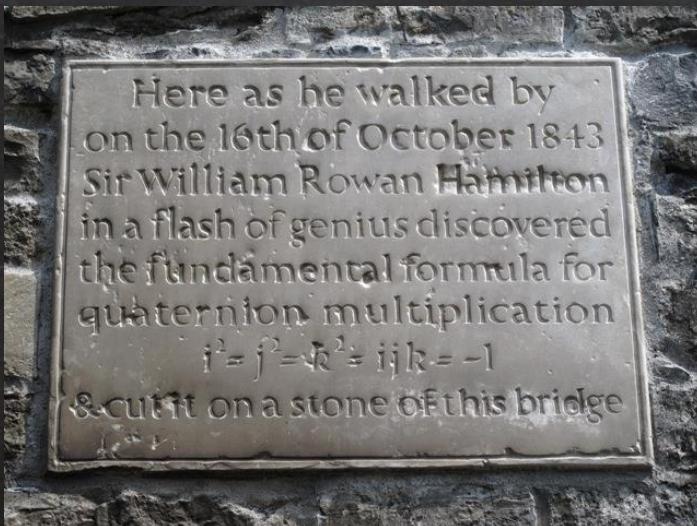

*Is it possible to extend this concept to 3D?*

# Quaternion

- Extend complex number to 3D

$$i^2 = j^2 = k^2 = ijk = -1$$

$$\begin{array}{lll} ij = k, & jk = i, & ki = j \\ ji = -k, & kj = -i, & ik = -j \end{array}$$

William Rowan Hamilton (1805–1865)

# Quaternion

- Can be represented in several ways:

$$q = (w, x, y, z)$$

$$q = w + xi + yj + zk$$

$$q = w + \boldsymbol{v}$$

The diagram illustrates the decomposition of a quaternion  $q$  into its scalar and vector components. It shows the quaternion  $q = w + \boldsymbol{v}$  with two blue arrows pointing upwards from the labels "scalar part" and "vector part". The label "scalar part" points to the scalar component  $w$ , and the label "vector part" points to the vector component  $\boldsymbol{v}$ .

scalar part      vector part

# Quaternion

$$i^2 = j^2 = k^2 = ijk = -1$$

$$\begin{array}{lll} ij = k, & jk = i, & ki = j \\ ji = -k, & kj = -i, & ik = -j \end{array}$$

## Hamilton product

$$\begin{aligned} q_0 * q_1 &= (w_0 + x_0i + y_0j + z_0k) * (w_1 + x_1i + y_1j + z_1k) \\ &= w_0w_1 - x_0x_1 - y_0y_1 - z_0z_1 \\ &\quad + (w_0x_1 + x_0w_1 + y_0z_1 - z_0y_1)i \\ &\quad + (w_0y_1 + y_0w_1 - x_0z_1 + z_0x_1)j \\ &\quad + (w_0z_1 + z_0w_1 + x_0y_1 - y_0x_1)k \end{aligned}$$

# Quaternion

$$i^2 = j^2 = k^2 = ijk = -1$$

$$\begin{array}{lll} ij = k, & jk = i, & ki = j \\ ji = -k, & kj = -i, & ik = -j \end{array}$$

## Hamilton product

$$q_0 * q_1 = (w_0 + x_0i + y_0j + z_0k) * (w_1 + x_1i + y_1j + z_1k)$$

$$\begin{aligned} &= w_0w_1 - x_0x_1 - y_0y_1 - z_0z_1 \\ &\quad + (w_0x_1 + x_0w_1 + y_0z_1 - z_0y_1)i \\ &\quad + (w_0y_1 + y_0w_1 - x_0z_1 + z_0x_1)j \\ &\quad + (w_0z_1 + z_0w_1 + x_0y_1 - y_0x_1)k \end{aligned}$$

$$= w_0w_1 - \mathbf{v}_0 \cdot \mathbf{v}_1 + w_0\mathbf{v}_1 + w_1\mathbf{v}_0 + \mathbf{v}_0 \times \mathbf{v}_1$$

# Quaternion

$$i^2 = j^2 = k^2 = ijk = -1$$

$$\begin{array}{lll} ij = k, & jk = i, & ki = j \\ ji = -k, & kj = -i, & ik = -j \end{array}$$

## Hamilton product

$$q_0 * q_1 = (w_0 + x_0i + y_0j + z_0k) * (w_1 + x_1i + y_1j + z_1k)$$

$$\begin{aligned} &= w_0w_1 - x_0x_1 - y_0y_1 - z_0z_1 \\ &\quad + (w_0x_1 + x_0w_1 + y_0z_1 - z_0y_1)i \\ &\quad + (w_0y_1 + y_0w_1 - x_0z_1 + z_0x_1)j \\ &\quad + (w_0z_1 + z_0w_1 + x_0y_1 - y_0x_1)k \end{aligned}$$

$$= w_0w_1 - \mathbf{v}_0 \cdot \mathbf{v}_1 + w_0\mathbf{v}_1 + w_1\mathbf{v}_0 + \mathbf{v}_0 \times \mathbf{v}_1$$

non-commutative!

$$q_1 * q_0 \neq q_0 * q_1$$

## Quaternion (Cont'd)

- Identity:  $\mathbf{q} = (1, 0, 0, 0)^T$
- Conjugate:  $q^* = (w, -\mathbf{v})$ 
  - $(q^*)^* = q$
  - $(pq)^* = q^*p^*$
  - $(p + q)^* = p^* + q^*$
- $q_0 + q_1 = (w_0 + w_1, \mathbf{v}_0 + \mathbf{v}_1)$
- $\alpha q = q\alpha = (\alpha w, \alpha \mathbf{v})$

## Quaternion (Cont'd)

- Norm:  $N(q) = qq^* = q^*q = w^2 + x^2 + y^2 + z^2$ 
  - $N(\mathbf{q}_0\mathbf{q}_1) = N(\mathbf{q}_0)N(\mathbf{q}_1)$
  - $N(q^*) = N(q)$
- Inverse:  $\mathbf{q}^{-1} = \frac{q^*}{N(q)}$ 
  - $\mathbf{q} \circ \mathbf{q}^{-1} = \mathbf{q}^{-1} \circ \mathbf{q} = (1, 0, 0, 0)^T$
  - $(\mathbf{q}_0\mathbf{q}_1)^{-1} = \mathbf{q}_1^{-1}\mathbf{q}_0^{-1}$
- Difference:  $\mathbf{q}_0\mathbf{q}_d = \mathbf{q}_1 \Rightarrow \mathbf{q}_d = \mathbf{q}_0^{-1}\mathbf{q}_1$

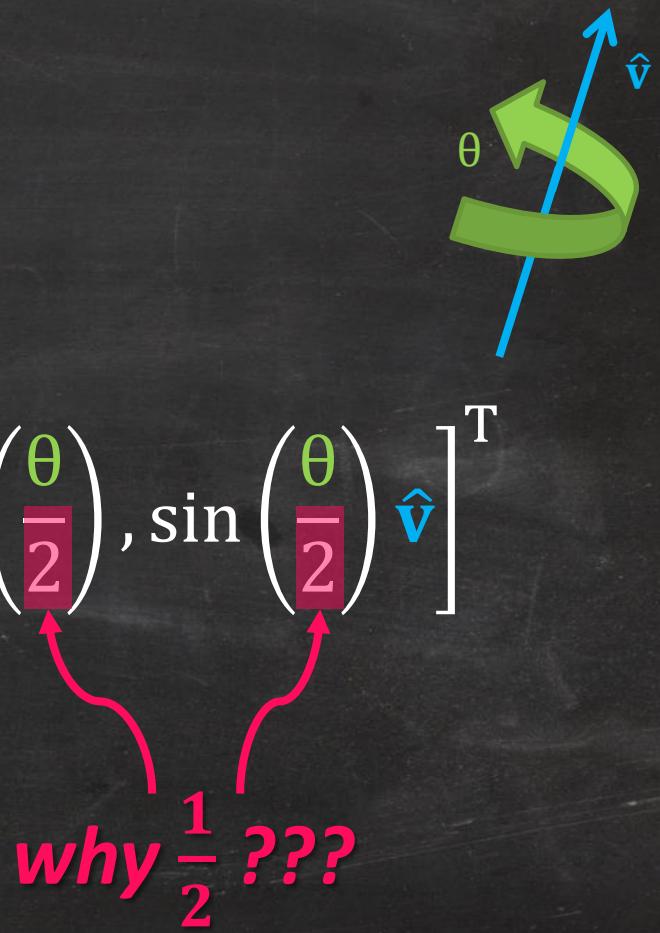

# Unit Quaternion

$$\mathbf{q} = (w, x, y, z)^T = \left[ \cos\left(\frac{\theta}{2}\right), \sin\left(\frac{\theta}{2}\right) \hat{v} \right]^T$$

# Unit Quaternion

$$\mathbf{q} = (w, x, y, z)^T = \left[ \cos\left(\frac{\theta}{2}\right), \sin\left(\frac{\theta}{2}\right) \hat{\mathbf{v}} \right]^T$$

# Rotation with Quaternion

- $\mathbf{p}' = \text{Rotate}(\mathbf{p}) = \mathbf{q} \circ \tilde{\mathbf{p}} \circ \mathbf{q}^{-1}$ 
  - Rotate a vector  $\mathbf{p} \in \mathbb{R}^3$  by an **unit** quaternion  $\mathbf{q} \in \mathcal{S}^3$
  - $\tilde{\mathbf{p}} = (\mathbf{0}, \mathbf{p})^T$  extended with a **zero scalar** component
  - $\text{Rotate}()$  function would *strips off* the scalar part of quaternion

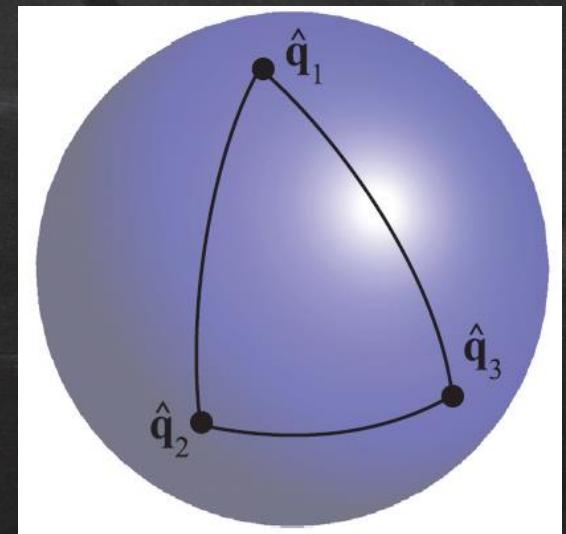

Figure from Real-time Rendering, 3/e

# Quaternion – Why $\theta/2$ ??

**Recall:**  $q_0 q_1 = w_0 w_1 - \mathbf{v}_0 \cdot \mathbf{v}_1 + \mathbf{w}_0 \mathbf{v}_1 + w_1 \mathbf{v}_0 + \mathbf{v}_0 \times \mathbf{v}_1$

$$\begin{aligned} qpq^{-1} &= (w + t\hat{v})\vec{p}(w + t\hat{v})^{-1} \\ &= (-t\hat{v} \cdot \vec{p} + w\vec{p} + t\hat{v} \times \vec{p})(w - t\hat{v}) \\ &= -wt\hat{v} \cdot \vec{p} + (w\vec{p} + t\hat{v} \times \vec{p}) \cdot t\hat{v} + w(w\vec{p} + t\hat{v} \times \vec{p}) \\ &\quad + (t\hat{v} \cdot \vec{p})t\hat{v} - (w\vec{p} + t\hat{v} \times \vec{p}) \times t\hat{v} \\ &= w^2\vec{p} + 2wt\hat{v} \times \vec{p} + t^2(\hat{v} \cdot \vec{p})\hat{v} - t^2\hat{v} \times \vec{p} \times \hat{v} \\ &= (w^2 - t^2)\vec{p} + 2wt\hat{v} \times \vec{p} + 2t^2(\vec{p} \cdot \hat{v})\hat{v} \end{aligned}$$

ps. suppose  $q$  is an **unit** quaternion

# Quaternion – Why $\theta/2$ ??

**Recall:**  $q_0 q_1 = w_0 w_1 - \mathbf{v}_0 \cdot \mathbf{v}_1 + \mathbf{w}_0 \mathbf{v}_1 + w_1 \mathbf{v}_0 + \mathbf{v}_0 \times \mathbf{v}_1$

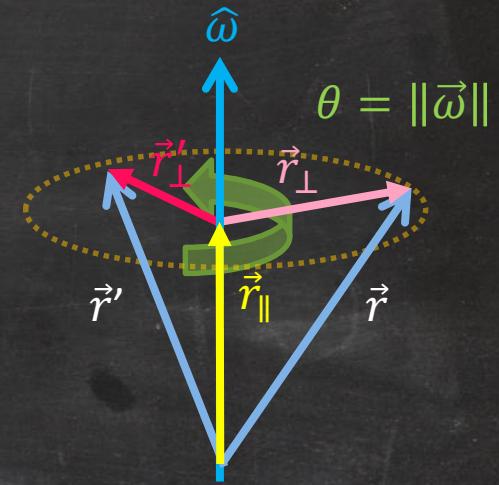

$$\begin{aligned} qpq^{-1} &= (w + t\hat{v})\vec{p}(w + t\hat{v})^{-1} \\ &= (-t\hat{v} \cdot \vec{p} + w\vec{p} + t\hat{v} \times \vec{p})(w - t\hat{v}) \\ &= -wt\hat{v} \cdot \vec{p} + (w\vec{p} + t\hat{v} \times \vec{p}) \cdot t\hat{v} + w(w\vec{p} + t\hat{v} \times \vec{p}) \\ &\quad + (t\hat{v} \cdot \vec{p})t\hat{v} - (w\vec{p} + t\hat{v} \times \vec{p}) \times t\hat{v} \\ &= w^2\vec{p} + 2wt\hat{v} \times \vec{p} + t^2(\hat{v} \cdot \vec{p})\hat{v} - t^2\hat{v} \times \vec{p} \times \hat{v} \\ &= (w^2 - t^2)\vec{p} + 2wt\hat{v} \times \vec{p} + 2t^2(\vec{p} \cdot \hat{v})\hat{v} \end{aligned}$$

*Look familiar??*

Recall

# Axis-Angle Rotation

$$\vec{r}' = \cos \theta \ \vec{r} + \sin \theta (\hat{\omega} \times \vec{r}) + (1 - \cos \theta)((\vec{r} \cdot \hat{\omega})\hat{\omega})$$

# Quaternion – Why $\theta/2$ ?? (Cont'd)

$$\begin{aligned} qpq^{-1} &= (w + t\hat{v})\vec{p}(w + t\hat{v})^{-1} \\ &= (-t\hat{v} \cdot \vec{p} + w\vec{p} + t\hat{v} \times \vec{p})(w - t\hat{v}) \\ &= -wt\hat{v} \cdot \vec{p} + (w\vec{p} + t\hat{v} \times \vec{p}) \cdot t\hat{v} + w(w\vec{p} + t\hat{v} \times \vec{p}) \\ &\quad + (t\hat{v} \cdot \vec{p})t\hat{v} - (w\vec{p} + t\hat{v} \times \vec{p}) \times t\hat{v} \\ &= w^2\vec{p} + 2wt\hat{v} \times \vec{p} + t^2(\hat{v} \cdot \vec{p})\hat{v} - t^2\hat{v} \times \vec{p} \times \hat{v} \\ &= (w^2 - t^2)\vec{p} + 2wt\hat{v} \times \vec{p} + 2t^2(\vec{p} \cdot \hat{v})\hat{v} \end{aligned}$$
$$\vec{r}' = \cos \theta \vec{r} + \sin \theta (\hat{\omega} \times \vec{r}) + (1 - \cos \theta)((\vec{r} \cdot \hat{\omega})\hat{\omega})$$

The diagram consists of three curved arrows. The first arrow points from the term  $(w^2 - t^2)\vec{p}$  in the quaternion result to the term  $\cos \theta \vec{r}$  in the final vector equation. The second arrow points from the term  $2wt\hat{v} \times \vec{p}$  in the quaternion result to the term  $\sin \theta (\hat{\omega} \times \vec{r})$  in the final vector equation. The third arrow points from the term  $2t^2(\vec{p} \cdot \hat{v})\hat{v}$  in the quaternion result to the term  $(1 - \cos \theta)((\vec{r} \cdot \hat{\omega})\hat{\omega})$  in the final vector equation.

# Quaternion – Why $\theta/2$ ?? (Cont'd)

$$w^2 - t^2 = \cos \theta$$

$$2wt = \sin \theta$$

$$2t^2 = 1 - \cos \theta \Rightarrow t = \sin \frac{\theta}{2} \Rightarrow w = \cos \frac{\theta}{2}$$

where  $2 \sin \theta \cos \theta = \sin 2\theta$

Therefore the **unit** quaternion is

$q = (\cos \left( \frac{\theta}{2} \right), \sin \left( \frac{\theta}{2} \right) \hat{v}) \leftrightarrow \text{rotate } \theta \text{ around axis } \hat{v}$

# Quaternion – Why $\theta/2$ ?? (Cont'd)

$$w^2 - t^2 = \cos \theta$$

$$2wt = \sin \theta$$

$w^2 + t^2$

## Read More

1. Quaternions, Ken Shoemake.
2. Game Physics 2/e, Ch10, David H. Eberly.

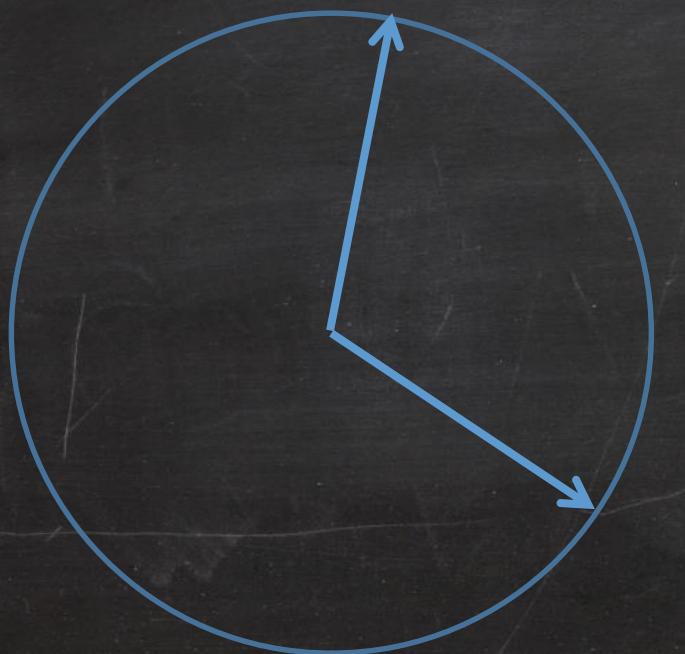

Therefore the **unit** quaternion is

$$q = \left( \cos\left(\frac{\theta}{2}\right), \sin\left(\frac{\theta}{2}\right) \hat{v} \right) \leftrightarrow \text{rotate } \theta \text{ around axis } \hat{v}$$

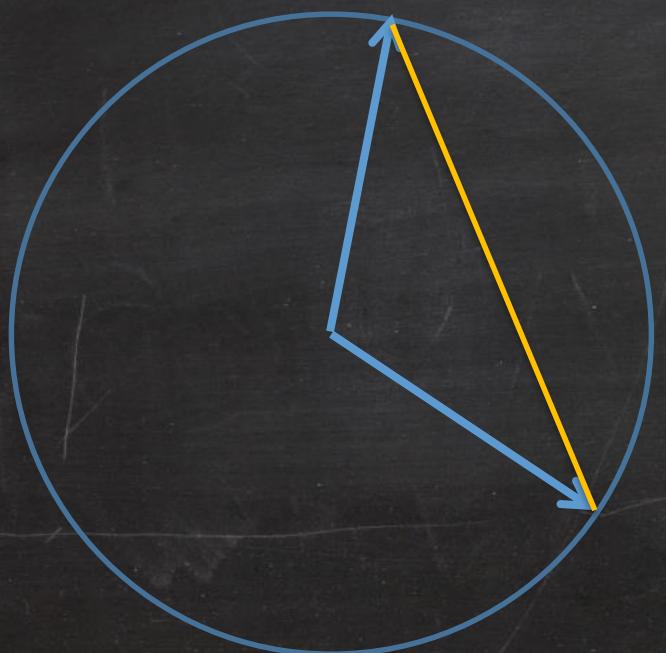

# Quaternion $qpq^{-1}$

- Concatenation
  - $q_1 \cdot (q_0 \cdot p \cdot q_0^{-1}) \cdot q_1^{-1} = (q_1 \cdot q_0) \cdot p \cdot (q_1 \cdot q_0)^{-1}$
- Any **non-zero** real multiple of  $q$  gives the same action
  - $(sq)p(sq)^{-1} = (sq)p(q^{-1}s^{-1}) = qpq^{-1}ss^{-1} = qpq^{-1}$

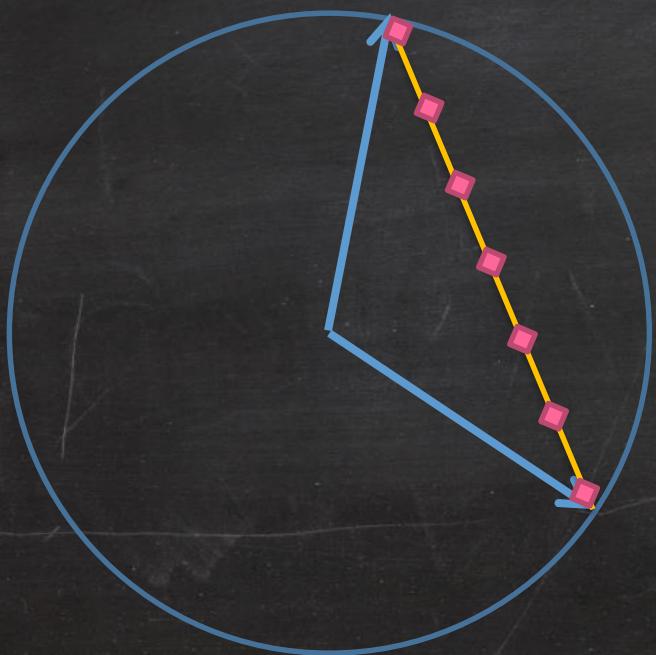

# Quaternion – Linear Interpolation

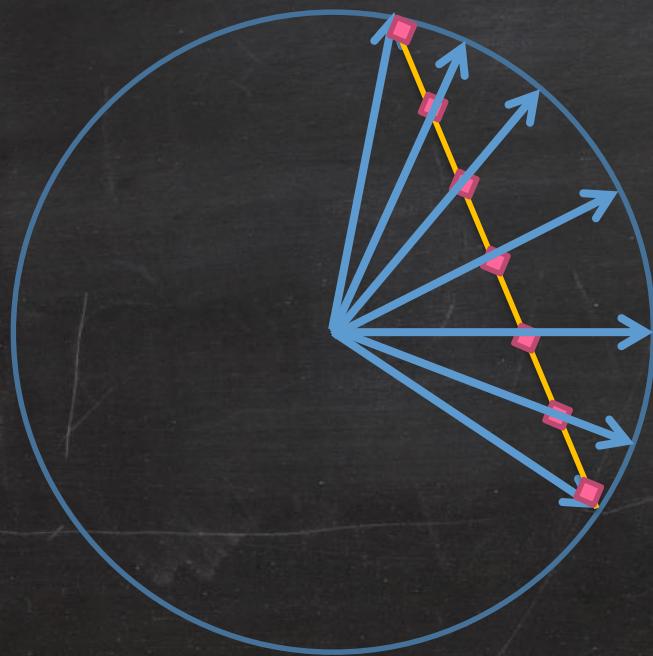

# Quaternion – Linear Interpolation

# Quaternion – Linear Interpolation

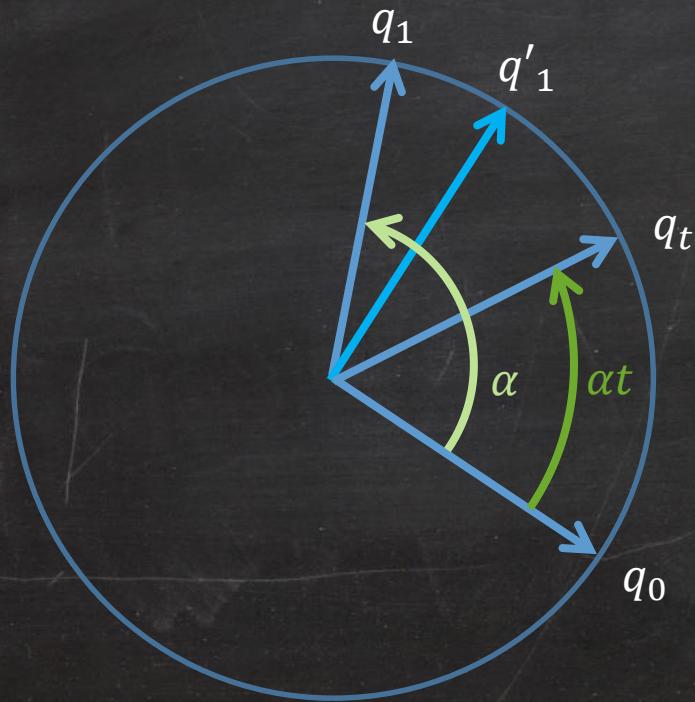

# Quaternion – Linear Interpolation

Its angular speed is **NOT** constant!

# Quaternion – Spherical Linear Interpolation

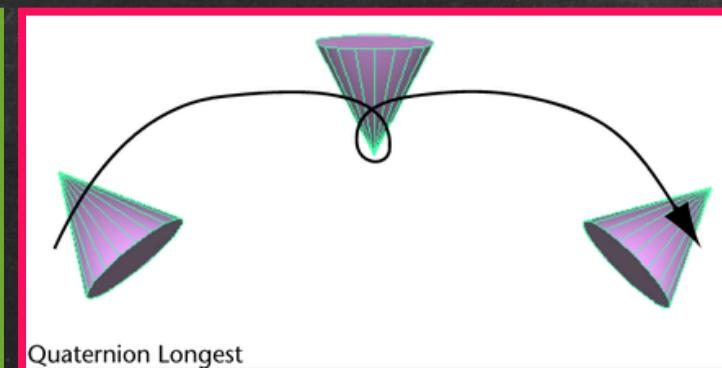

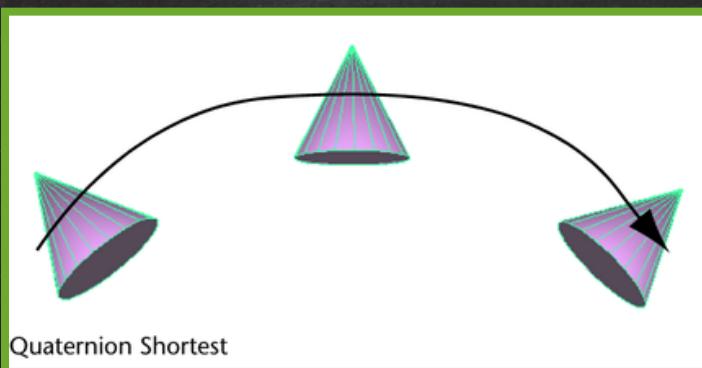

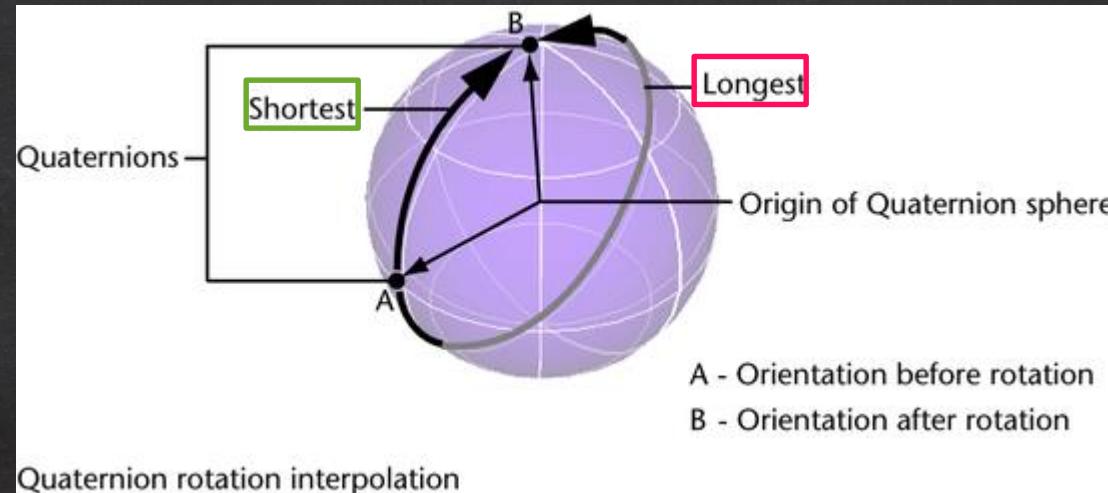

$$q_t = (\cos \alpha t)q_0 + (\sin \alpha t)q'_1$$

$$q'_1 = \frac{q_1 - \cos \alpha q_0}{\sin \alpha}$$

$$q_t = \frac{\sin(1-t)\alpha}{\sin \alpha} q_0 + \frac{\sin \alpha t}{\sin \alpha} q_1$$

Numerical error as  $\alpha \rightarrow 0$ , use lerp instead!

# Quaternion - Interpolation Path

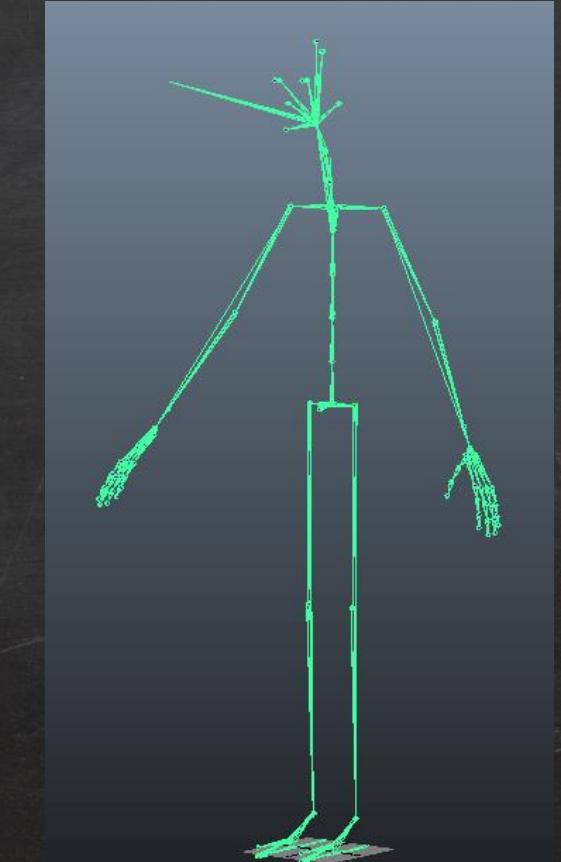

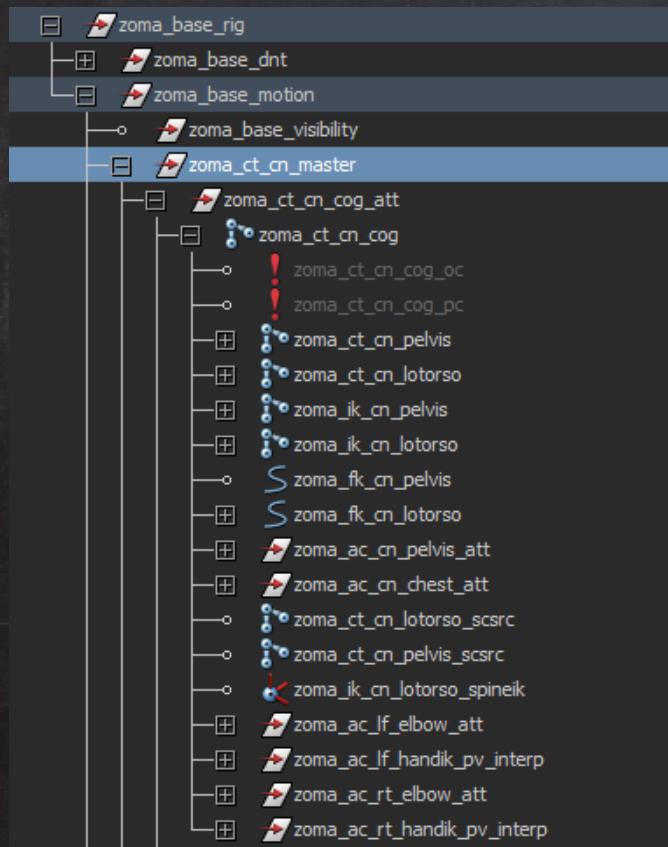

[Animated rotation in Maya](#)

# Why Quaternion?

- Smooth interpolation with slerp
- Without singularity (Gimbal Lock)
- Compact representation (only 4 numbers)
- Fast conversion from/to matrix representation
- Fast concatenation and inversion of angular displacements

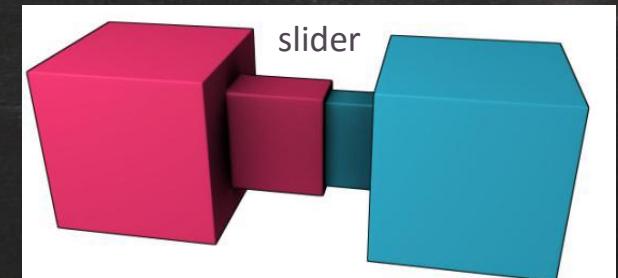

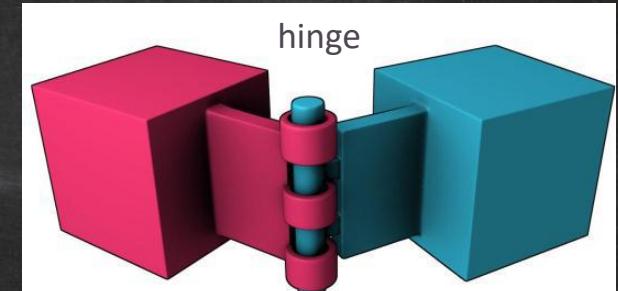

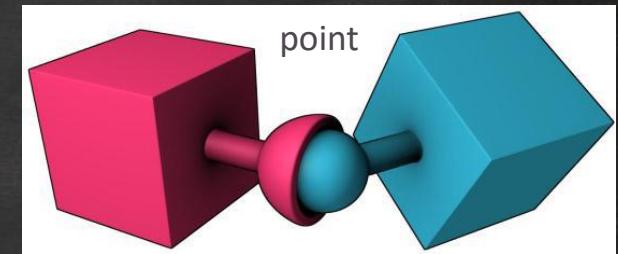

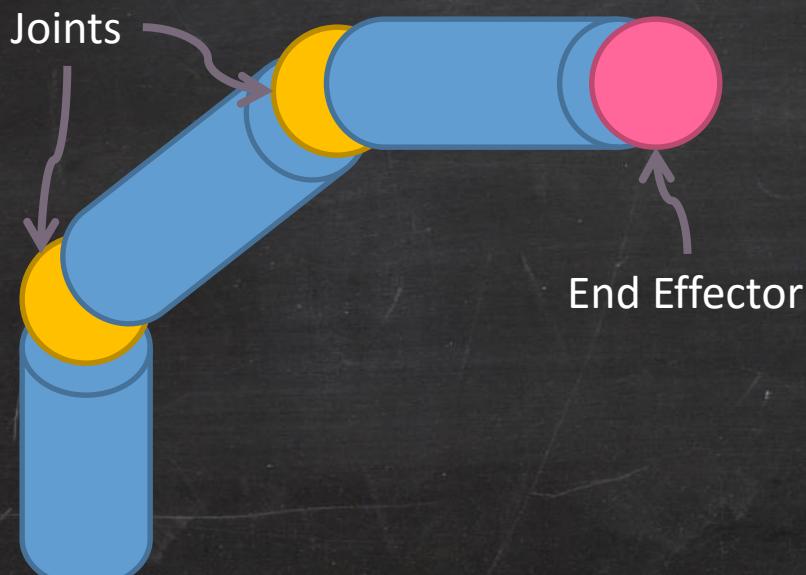

# Character Animation

2-anchor  $\tilde{L}$

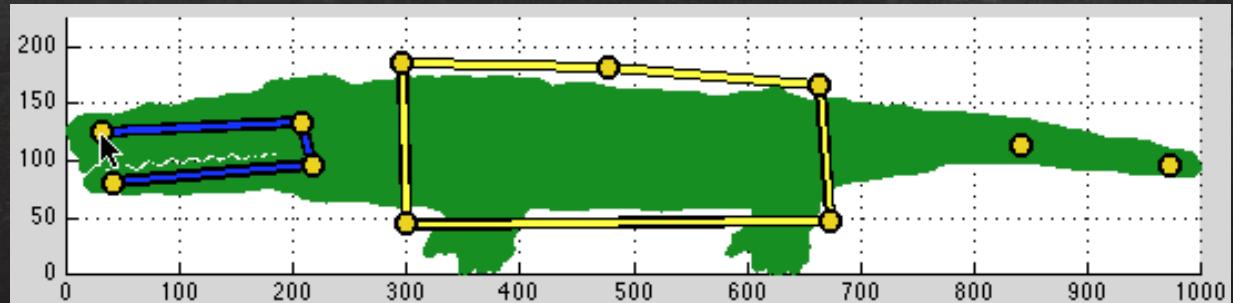

# *Deformation*

$shape = f(space)$   
*space/volume/free-form deformer*

$shape = f(shape)$   
*surface deformer*

# Deformer

- Change the position of vertices
  - Vertices in, vertices out
  - Topology is unchanged
- Users manipulate the shape via handles such as
  - curve
  - cage
  - proxy mesh
  - etc.

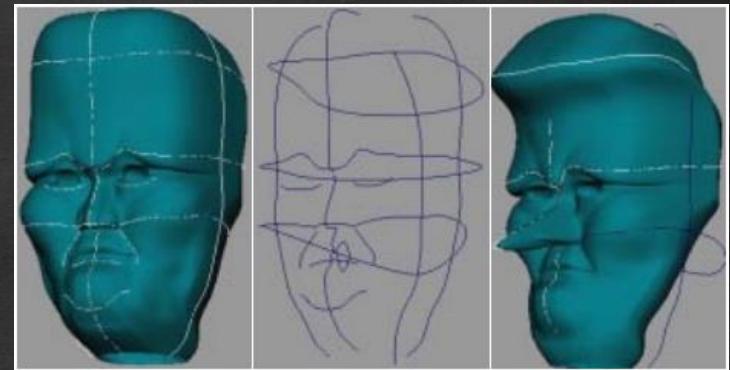

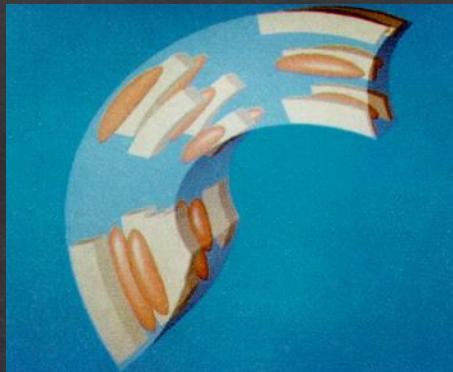

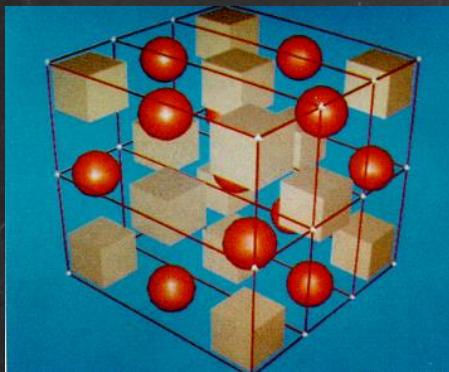

# Why Deformer?

- Manipulate mesh for aesthetic purposes
  - Squash, stretch, collision, etc.
- Character posing for animation
- Fake dynamics
  - Secondary animation by using procedural
- Simulation post-fix?
  - I think it would be great for production

# Deformer Requirements

- Sufficiently fast & robust
- Easy to setup and control
- Aesthetically pleasing
  - Physically plausible
  - Preserve local details or volume
- Large scale deformation (optional)

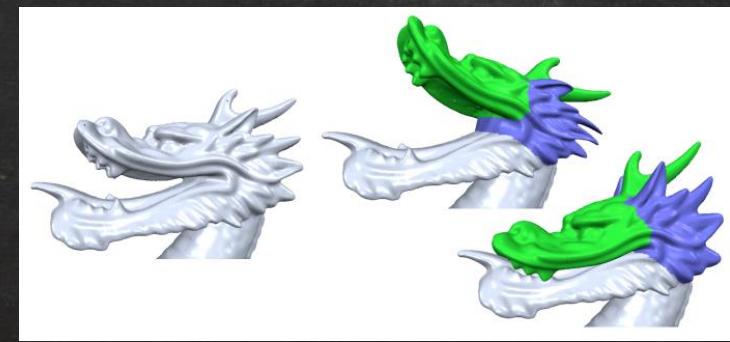

# Space Deformation: $shape = f(space)$

[Singh and Fiume 98]

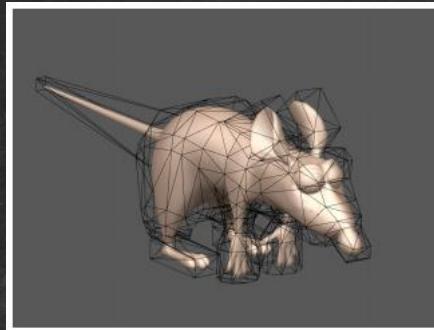

[Sederberg and Parry, SIG'86]

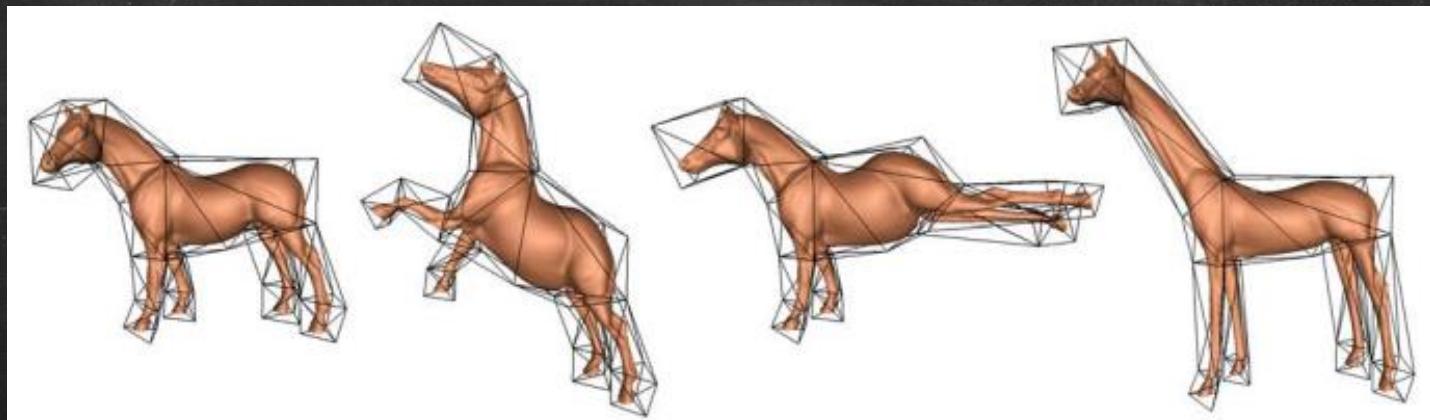

[Botsch and Kobbel, EG'05]

# Space Deformation: $shape = f(space)$

[Joshi et al., SIG'07]

[Ju et al., SIG'05]

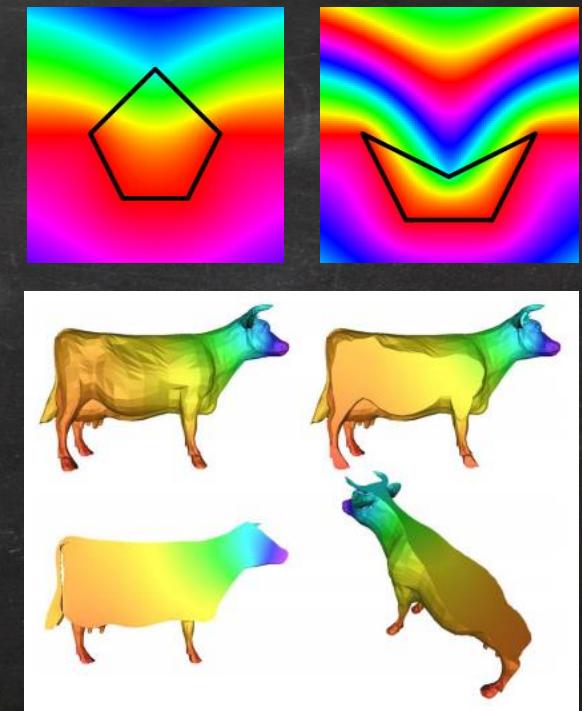

# Coordinate Mapping

- How do we compute the weights inside?  
Ans.: Generalized Barycentric Coordinates

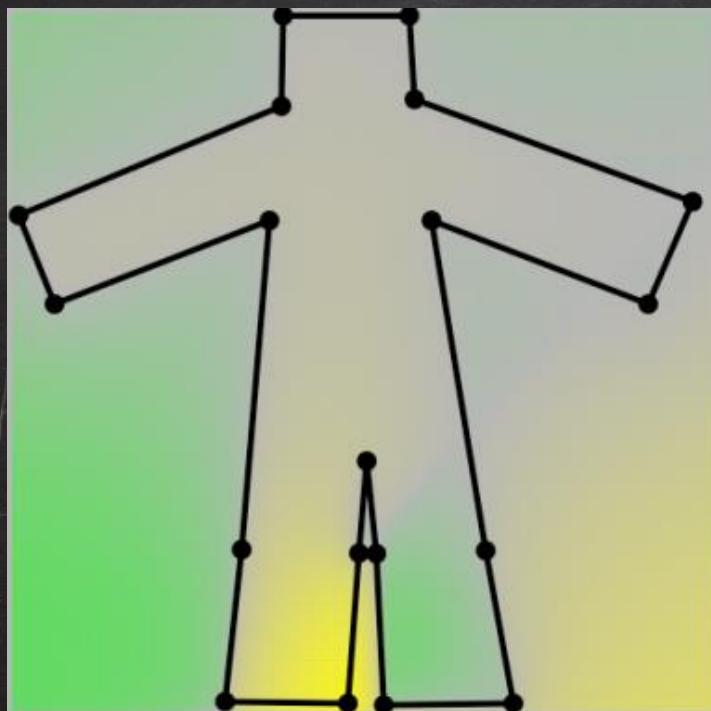

$$g(x) = \sum_{i=1}^n w_i(x) f_i$$

↑  
should be smooth!!

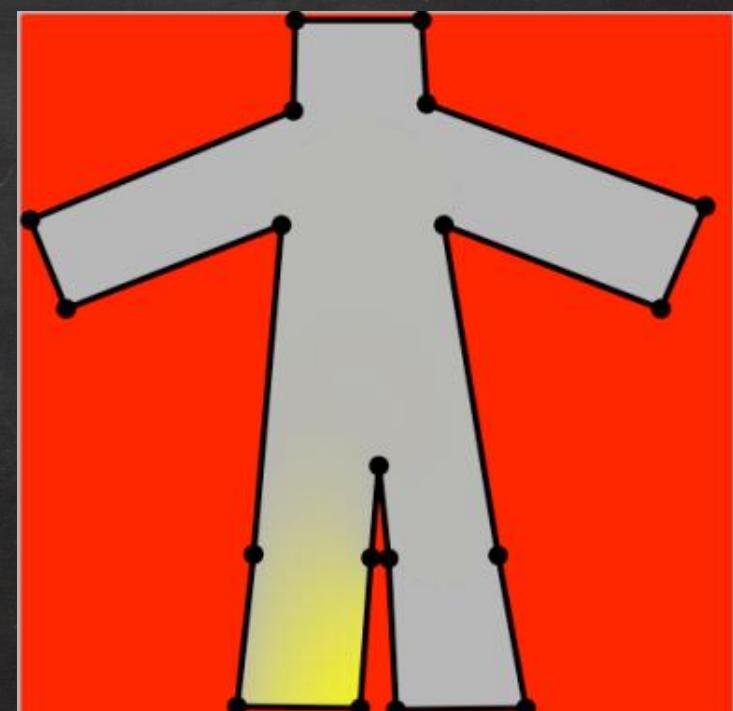

# Coordinate Mapping (Cont'd)

Mean Value Coordinate

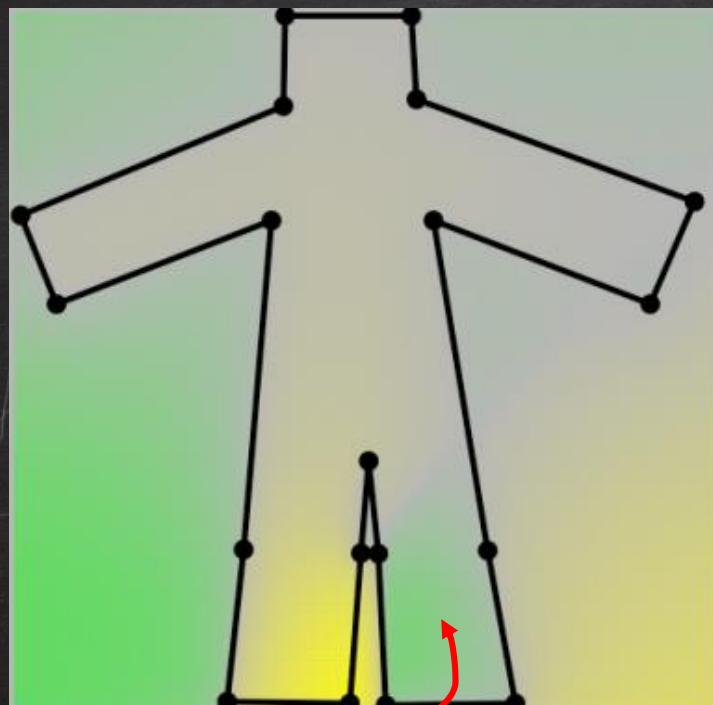

Harmonic Coordinate

[Joshi et al., SIG'07]

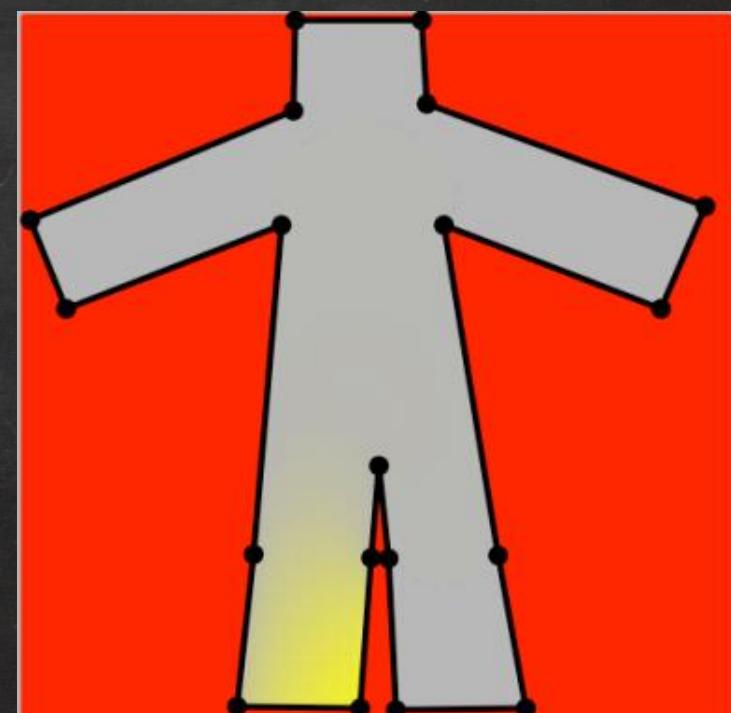

# Coordinate Mapping (Cont'd)

Mean Value Coordinate

negative weights!!

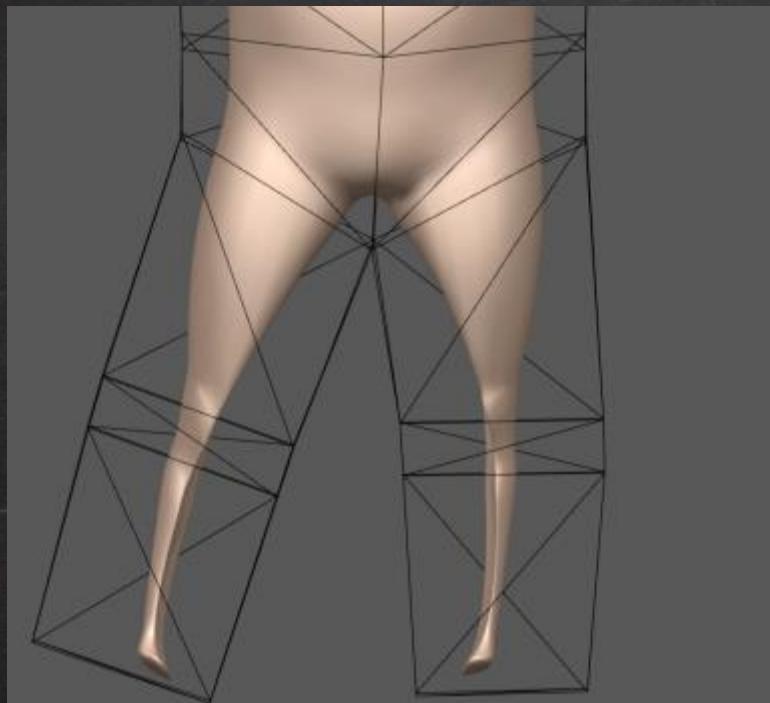

Harmonic Coordinate

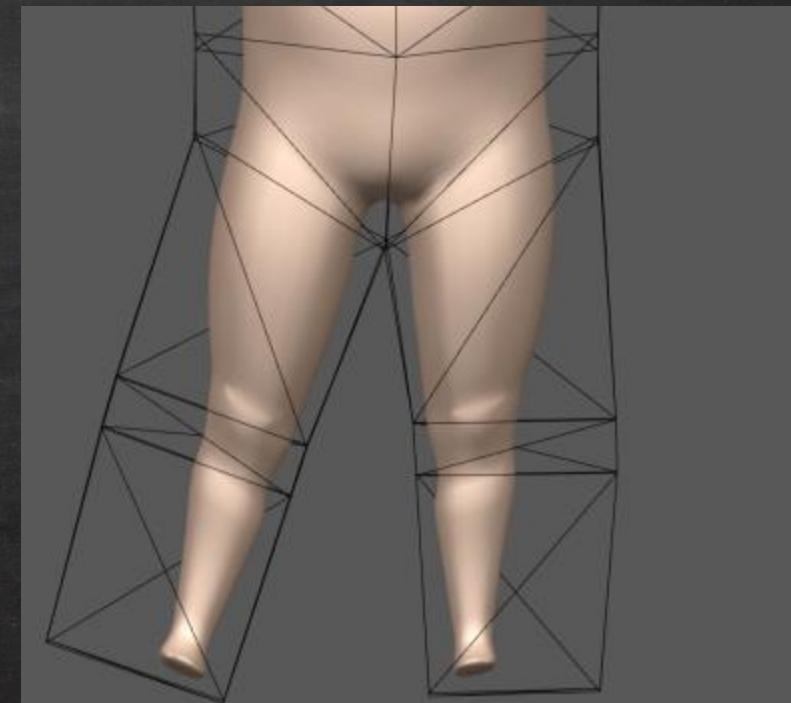

[Joshi et al., SIG'07]

# Coordinate Mapping (Cont'd)

Mean Value Coordinate

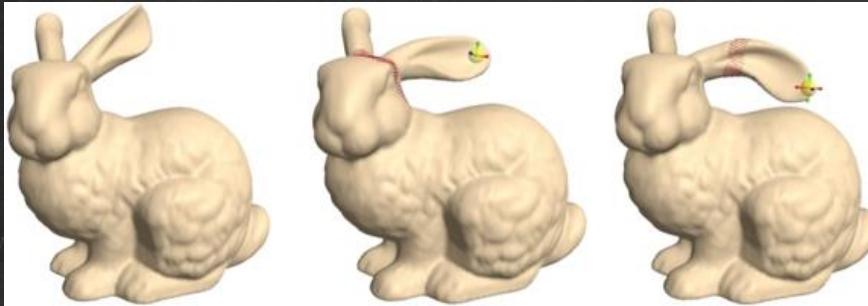

Harmonic Coordinate

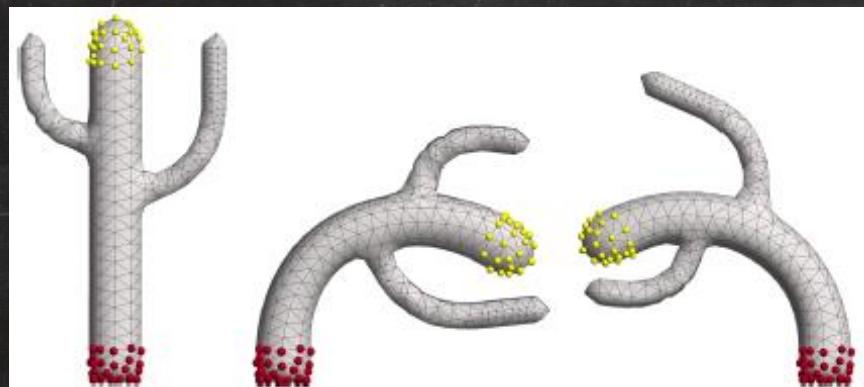

[Joshi et al., SIG'07]

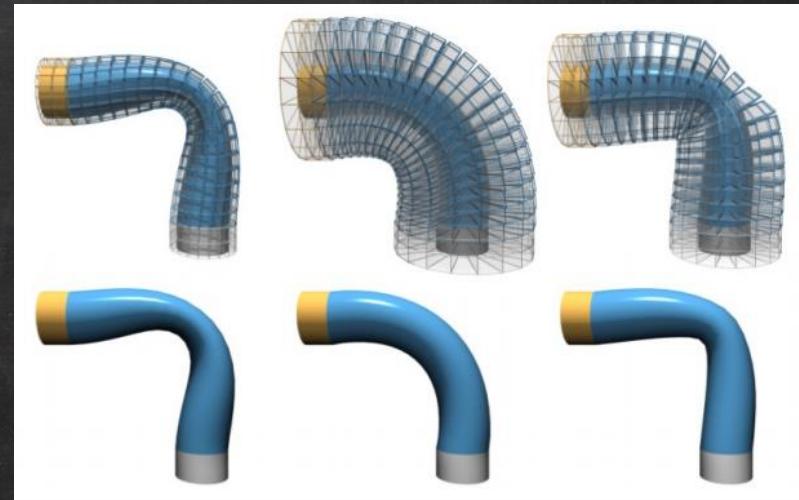

# Surface Deformation: $shape = f(shape)$

[Sorkine et al., SGP'04]

[Sorkine and Alexa, SGP'07]

[Botsch et al., SGP'06]

# General Framework of Surface Deformation

$$x' = \arg \min_{x'} f(x')$$

subject to  $x'_i = c_i$

# General Framework of Surface Deformation

objective (energy function)

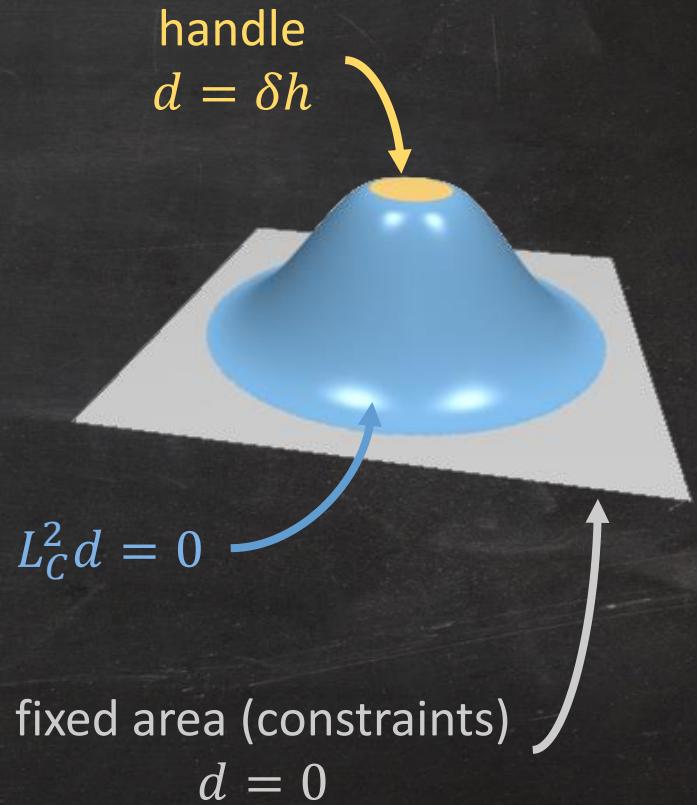

$$x' = \arg \min_{x'} f(x')$$

subject to  $x'_i = c_i$

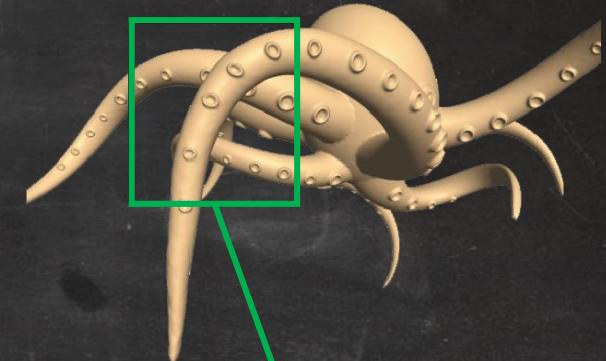

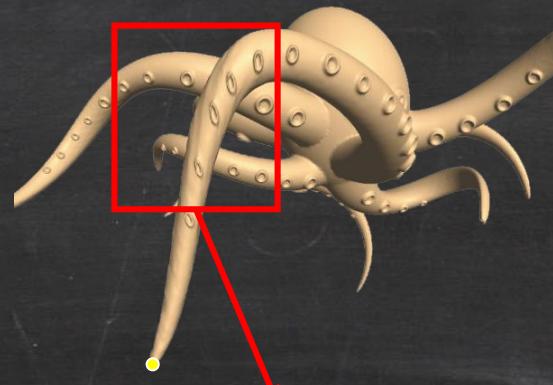

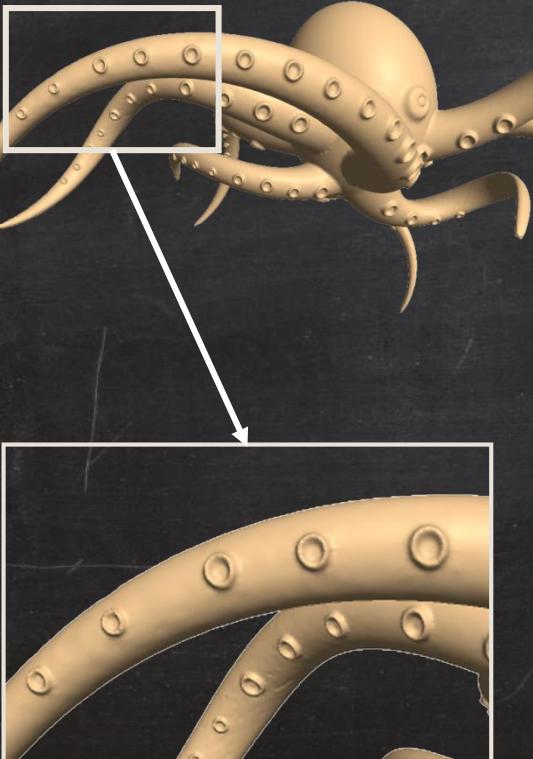

equality constraints

# Bi-Harmonic Deformation

$$\begin{bmatrix} L_c^2 & & \\ 0 & \mathbf{I} & 0 \\ 0 & 0 & \mathbf{I} \end{bmatrix} \begin{bmatrix} \vdots \\ d_i \\ \vdots \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ \delta h_i \end{bmatrix}$$

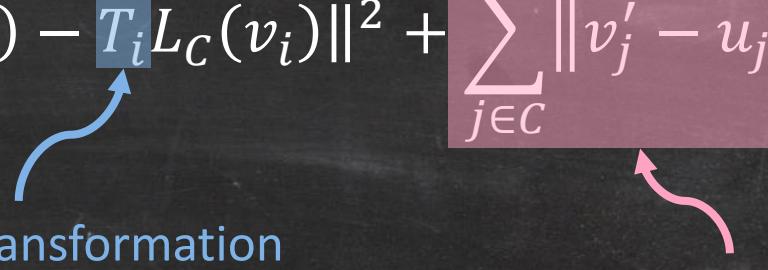

# Laplacian Surface Editing

# Laplacian Surface Editing (Cont'd)

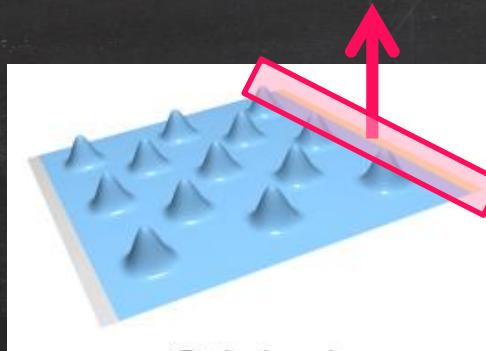

$$v' = \arg \min_{v'} \left( \sum_{i=1}^n \|L_c(v'_i) - T_i L_C(v_i)\|^2 + \sum_{j \in C} \|v'_j - u_j\|^2 \right)$$

similarity transformation      user constraints

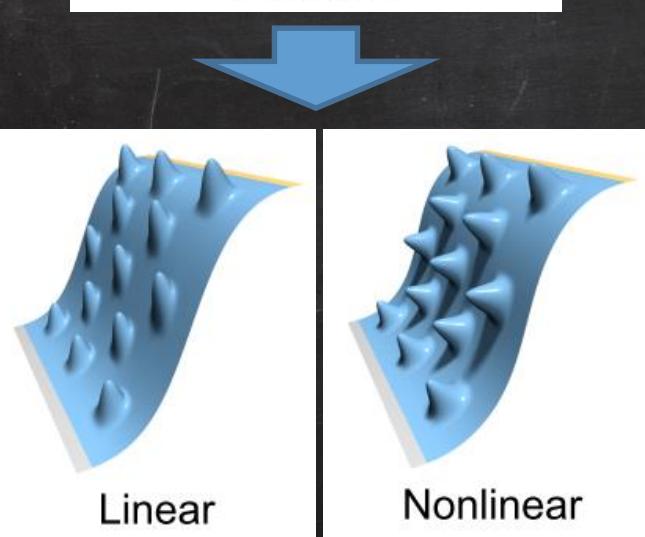

Laplacian coordinate is not rotation invariant,  
thus we need  $T_i$  for alignment (rotation + scale).

# Multiresolution Editing

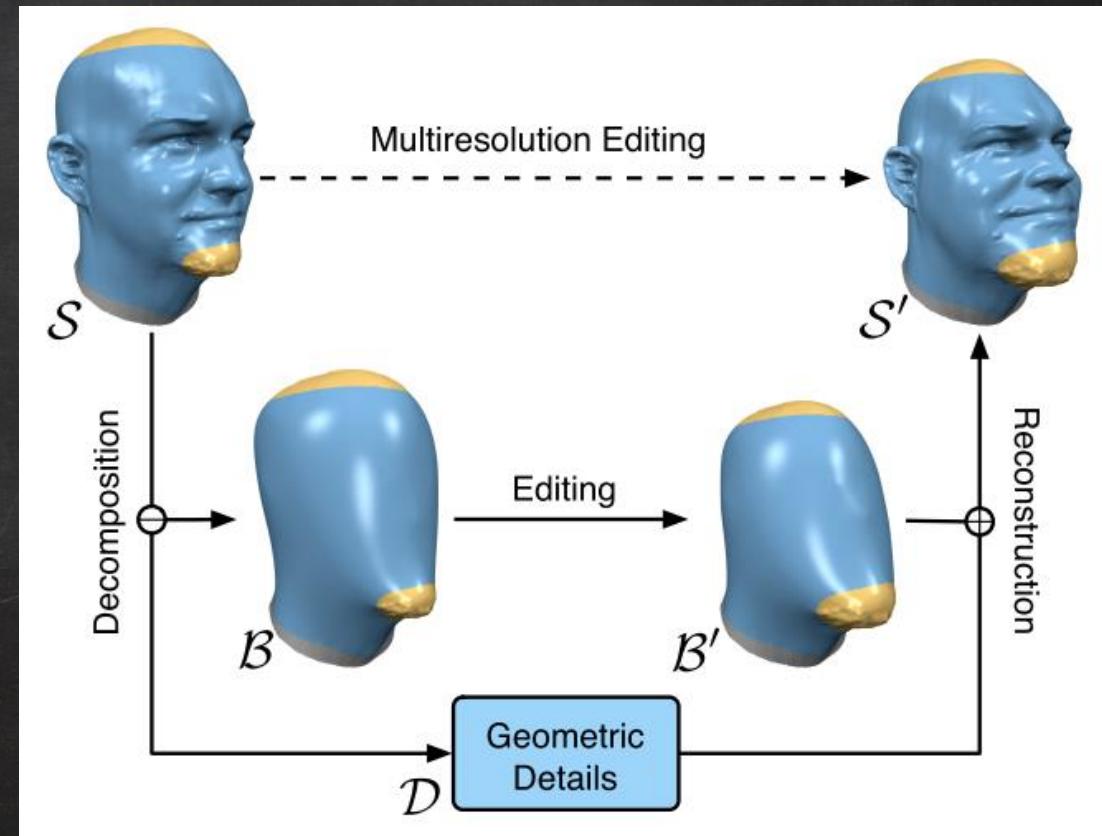

Original

Linear

Nonlinear

# Face Animation

- Given a set of models for each facial expression
  - Each model has identical topology
- How to tweak the expression via parameters?
  - PCA (Principal Component Analysis)
  - BlendShapes

# BlendShape

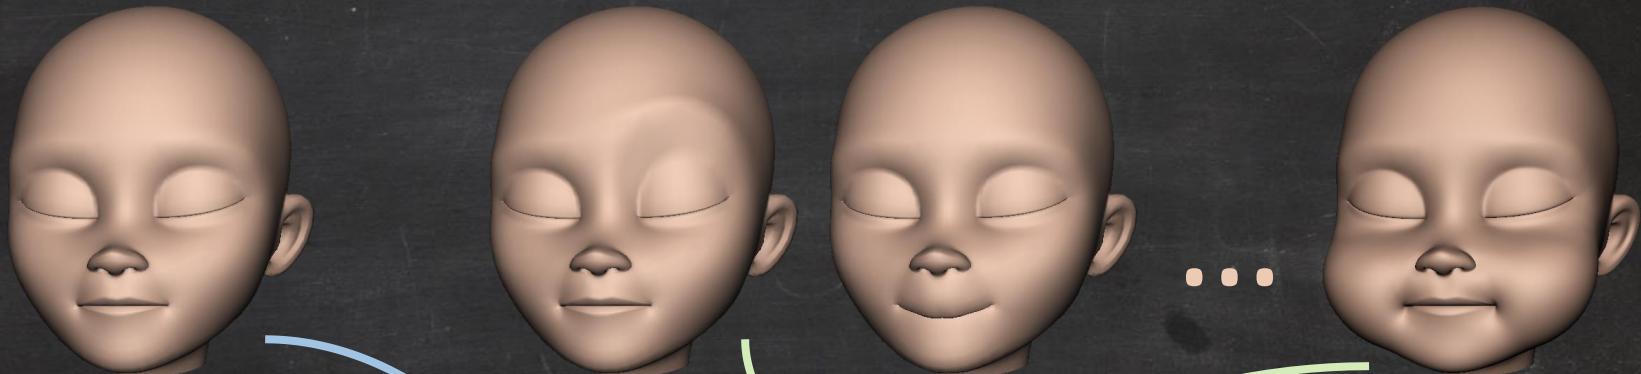

$$f = b_0 + \sum_{k=1}^n w_k(b_k - b_0)$$
$$f = b_0 + Bw$$

# BlendShape

$$f = b_0 + \sum_{k=1}^n w_k(b_k - b_0)$$
$$f = b_0 + Bw$$

# BlendShape

$$f = b_0 + \sum_{k=1}^n w_k (b_k - b_0)$$
$$f = b_0 + Bw$$

# Comparison

## PCA

- Orthogonal
- Lack the interpretability

## BlendShape

- Semantic parameterization
- Consistent appearance
- Lack of orthogonality
- Not unique:  
$$f = B(RR^{-1})w$$

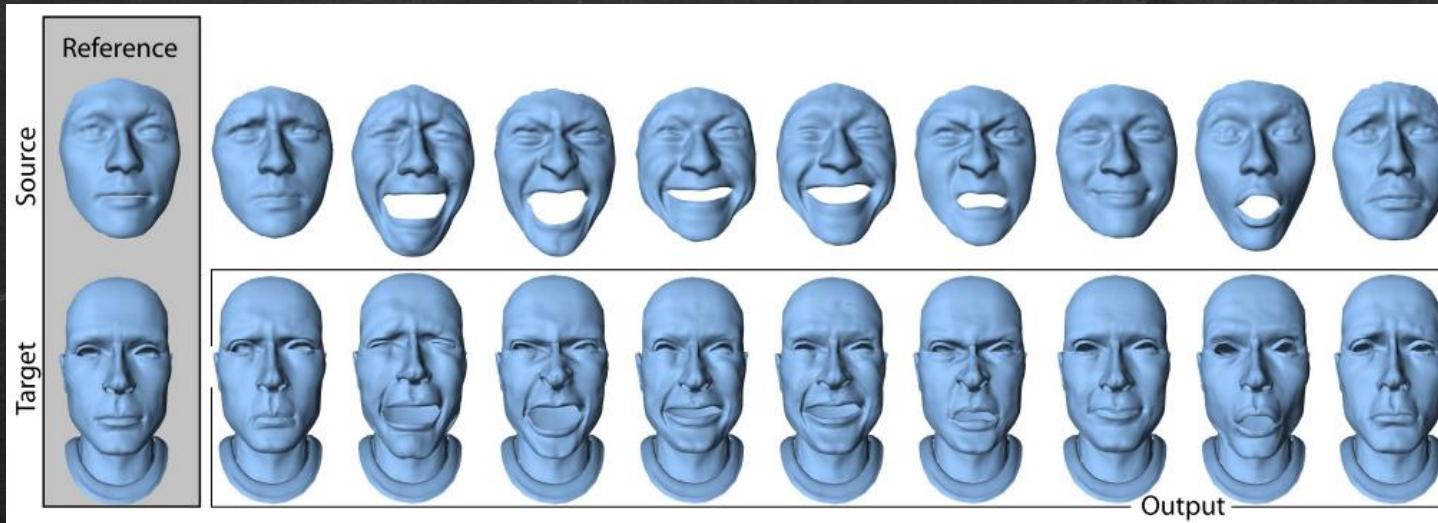

# Facial Action Coding System (FACS)

**Latest Result: 30 High-Res Expressions Processed in One Week**

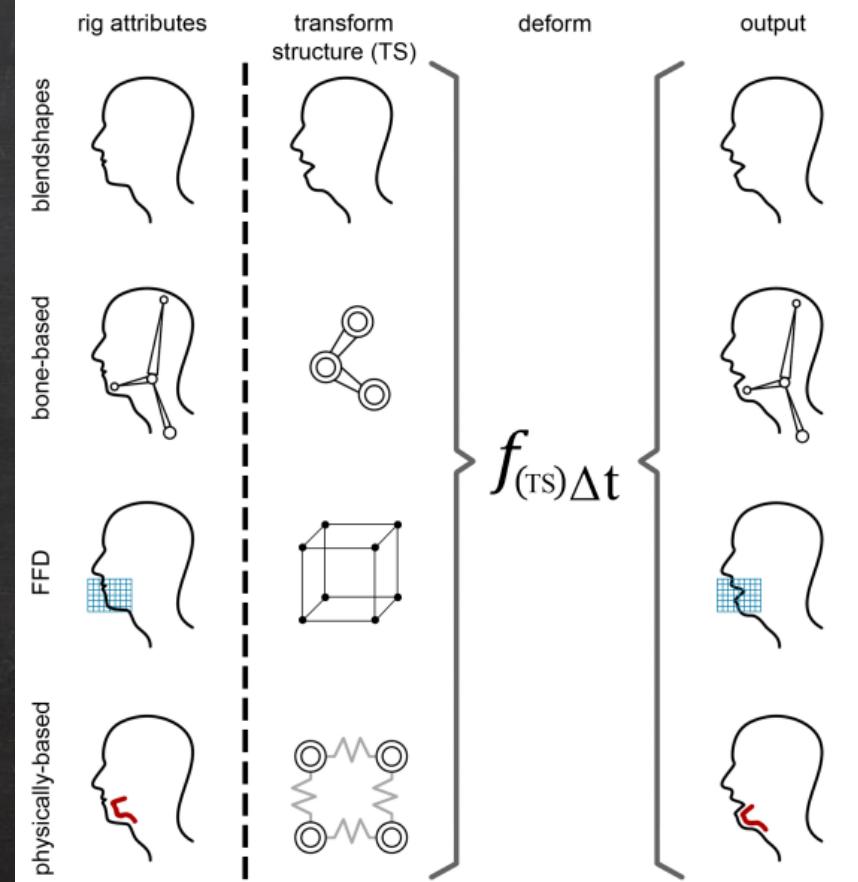

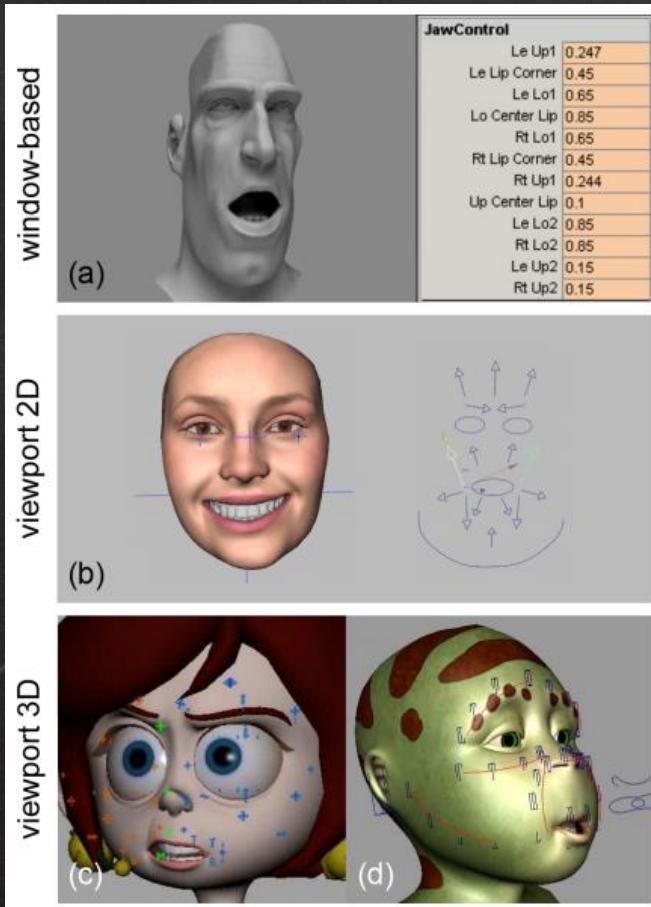

# Practical Issues

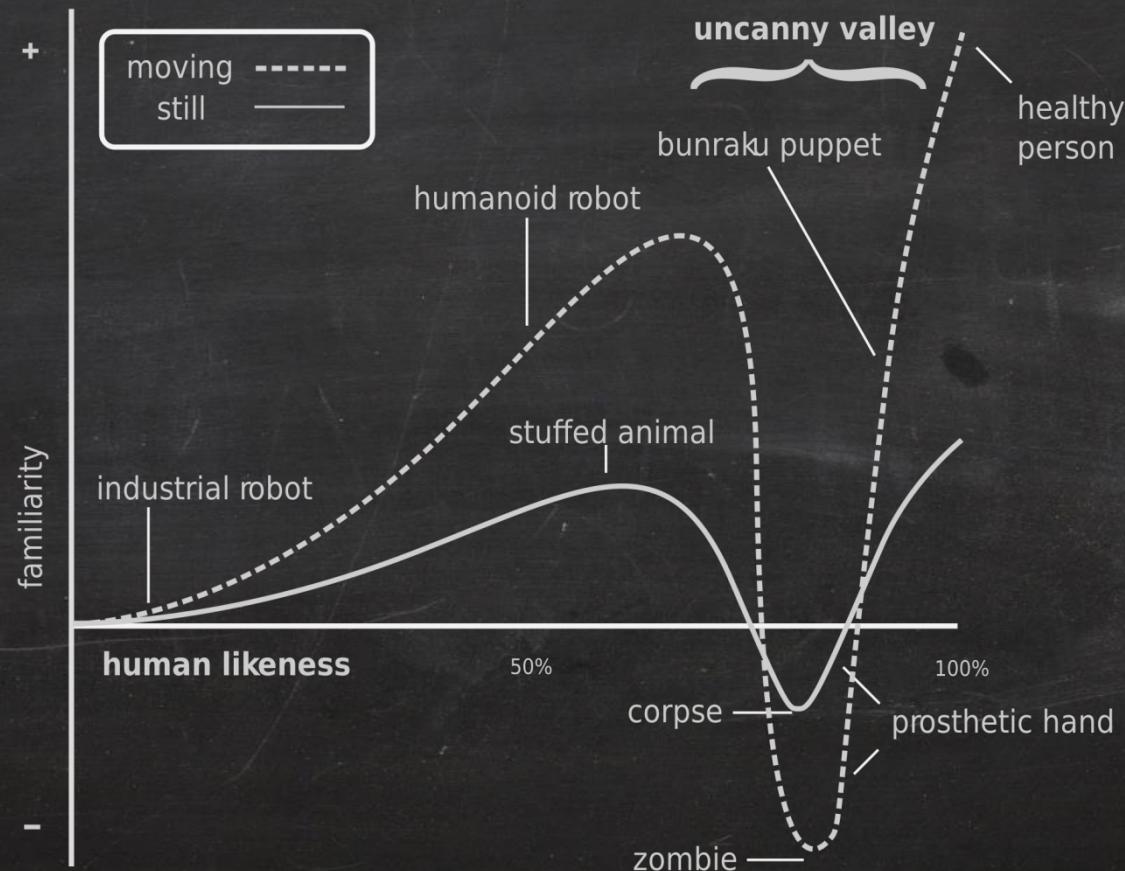

- How to compress BlendShape data?
- Expression transfer between multiple characters
  - Use **deformation transfer** for BlendShape targets

# Facial Rigging

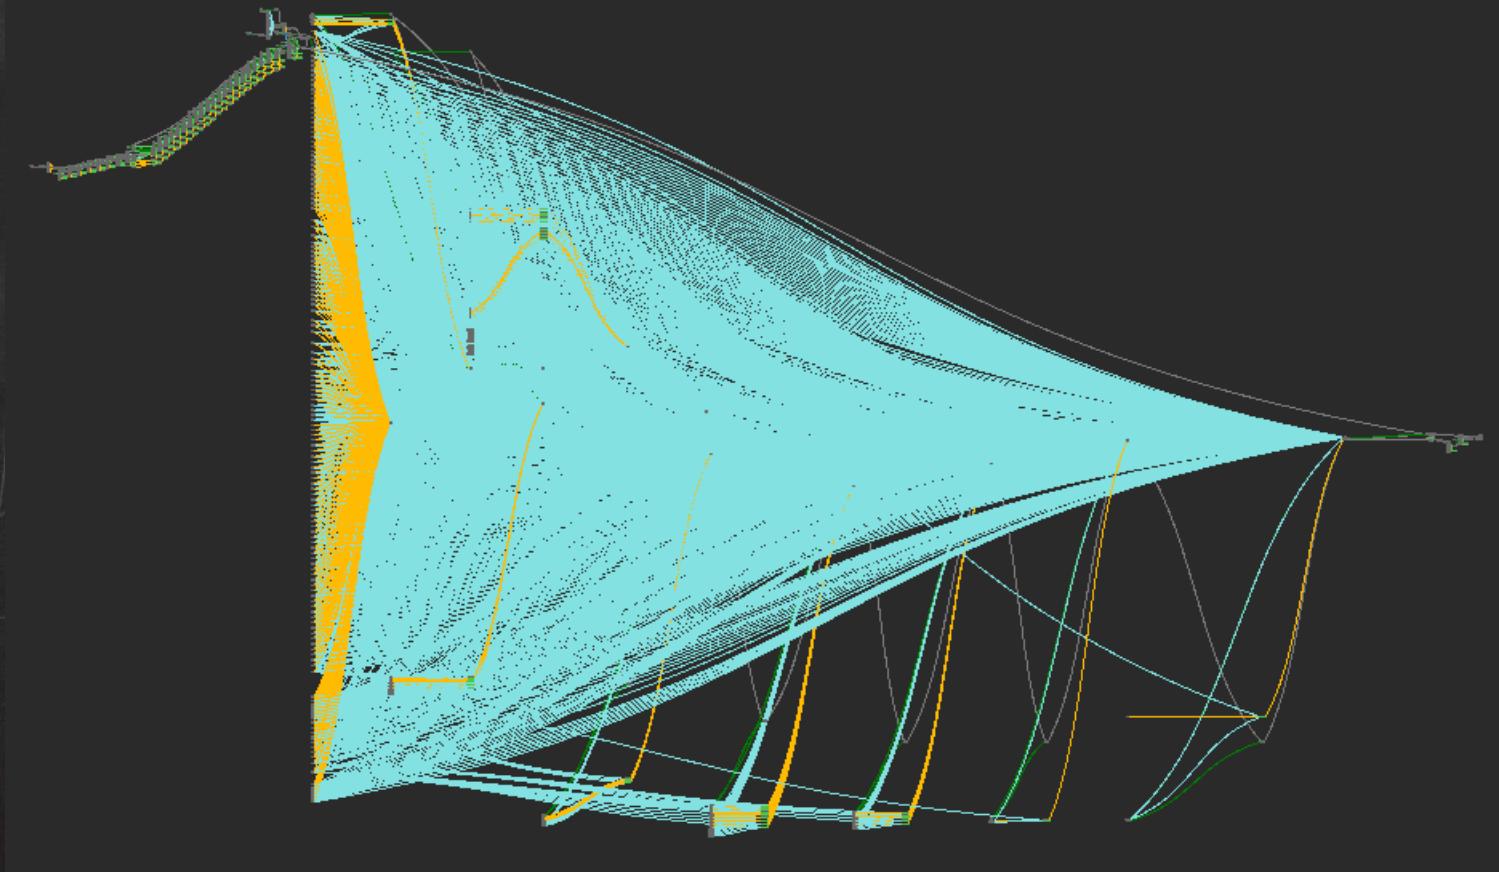

# Uncanny Valley

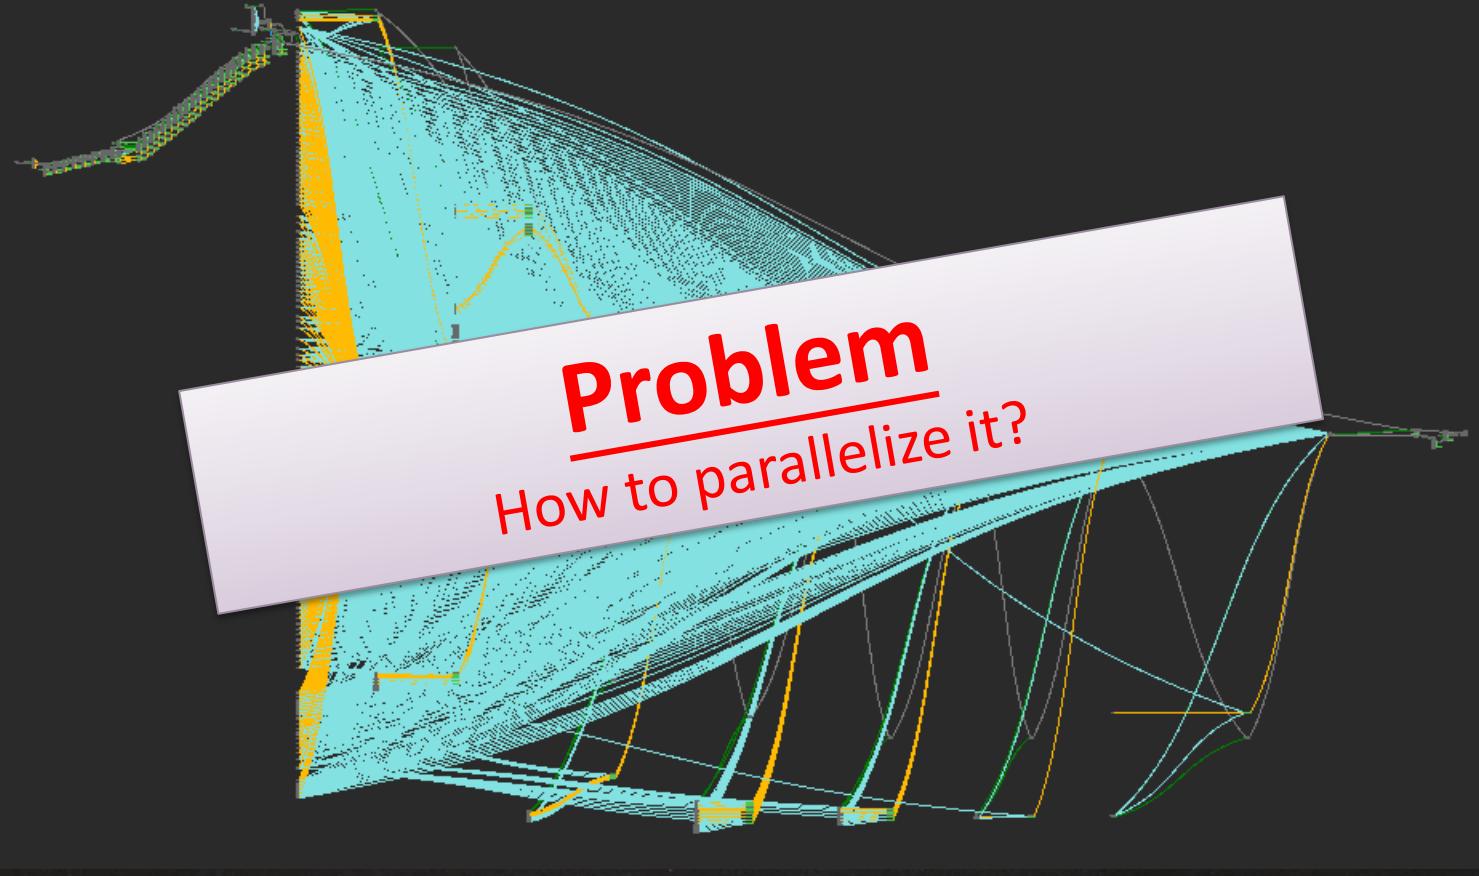

# Practical Issues

- How to provide intuitive controls?
  - Too many => hard to manipulate
  - Not enough => can't get enough animation details
- In node-based framework, computation = graph evaluation
  - How do we separate the evaluation graph for parallelism?

# Parallel Graph Evaluation

# Parallel Graph Evaluation

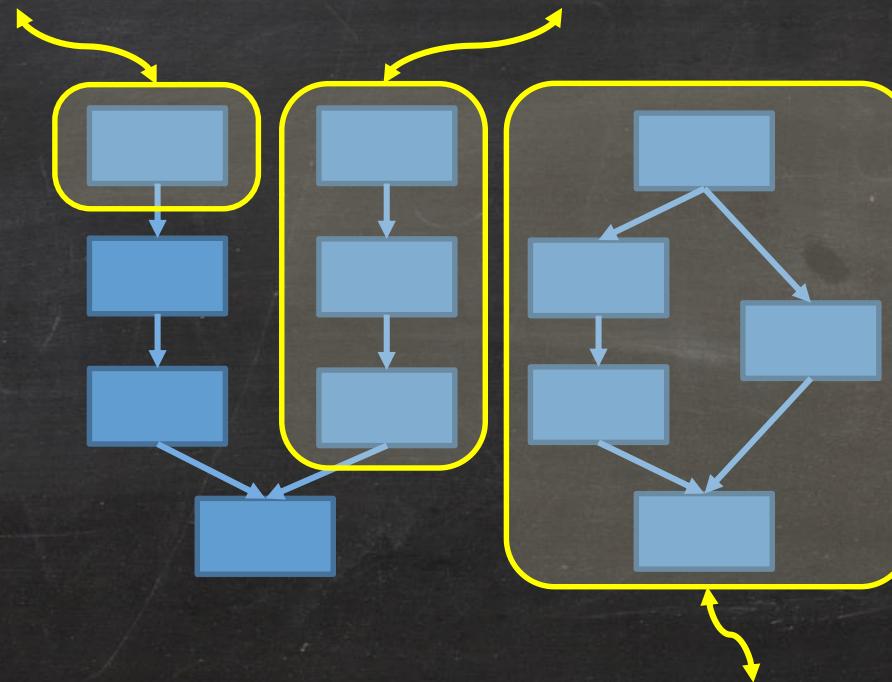

**Problem**  
How to parallelize it?

# Parallel Graph Evaluation (Cont'd)

- Parallelization is **NOT** just about using TBB or CUDA
- Graph analysis is a key for performance gain
  - But the graph evaluation routine in Maya is a black box!!
- Numerical issue
  - Consistency between serial and parallel implementation
    - Due to rounding error and truncation of floating point
  - Deterministic algorithm?

## *Force-Based Dynamics*

## *Position-Based Dynamics*

# Comparison

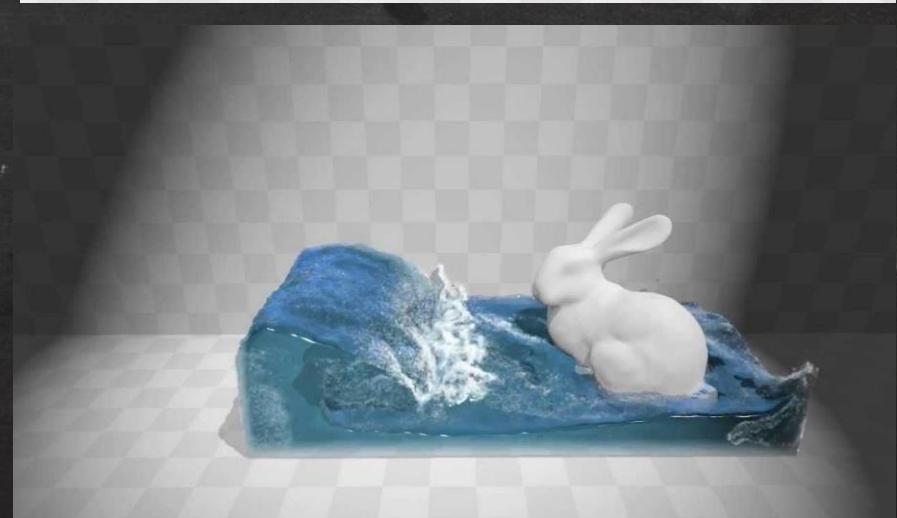

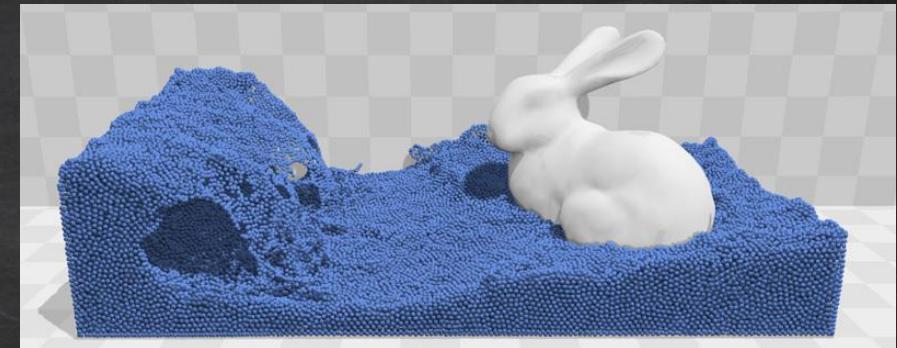

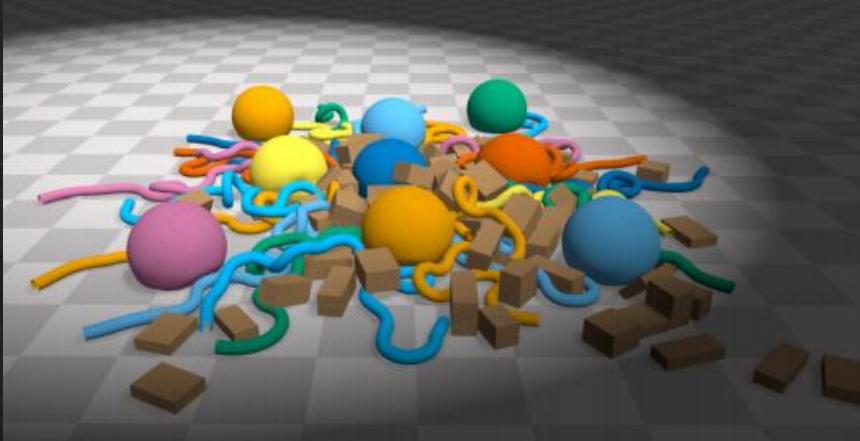

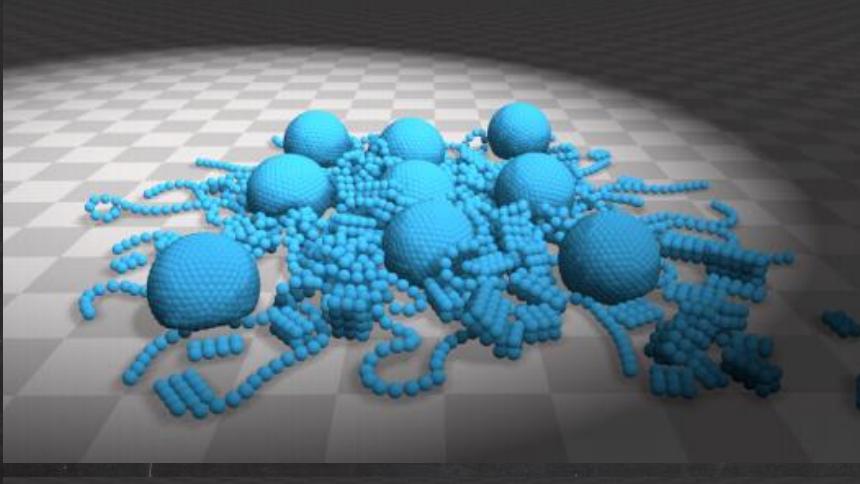

## Force-Based

- ✓ Physically accurate
  - Newton second law
  - Navier-Stokes
  - ..., etc.
- Explicit integration
  - Not stable for stiff system
  - Overshooting
- Implicit integration
  - Computationally expensive
  - Numerical damping

## Position-Based

- ✓ Fast
- ✓ Unconditionally stable
- ✓ Controllable
- Less physically accurate
- Need to explore new ways to update velocity
